## Product notice

This user guide describes features that are common to most models. Some features may not be available on your computer.
To access the latest user guides, go to http://www.hp.com/support, and follow the instructions to find your product. Then select User Guides.

## Software terms

By installing, copying, downloading, or otherwise using any software product preinstalled on this computer, you agree to be bound by the terms of the HP End User License Agreement (EULA). If you do not accept these license terms, your sole remedy is to return the entire unused product (hardware and software) within 14 days for a full refund subject to the refund policy of your seller.

For any further information or to request a full refund of the price of the computer, please contact your seller

## Chapter 1: About this Guide

## How to use this guide

This is a supplemental guide providing programming information on HP printers. This guide is written for techsavvy users who are interested in customizing or adjusting printer functionality and is meant to be used in conjunction with the User Guide.

If you experience any difficulties during the programming process or feel unsure of adjustments you have made, contact your HP representative for further assistance.

## Where to find the basics

If you are looking for information on setup or basic operation, refer to the User Guide. The programming guide assumes that you have the User Guide handy for reference or are already familiar with the printer.

## Where to find advanced technical information

This guide contains the most complete information available on programming the printer. If you cannot find what you need here or would like further guidance on how to program the printer, contact a HP representative for assistance.

## Support

For more advanced procedures and troubleshooting, you may need to refer to the printer's service guide or speak to a HP technical professional. Your representative is able to provide you with necessary information.

For on-line service, go to www.hp.com/support.

## Chapter 2: Configuration

The printer can be configured with the following settings and functions through the configuration menu that is printed on the receipt.

Communication interfaces
Software options
Hardware options
Paper type

## Indicators

The printer communicates various conditions with the status LED. The following table lists these indicators.

| Indicator | Sequence | Condition |
| :---: | :---: | :---: |
| Green | ON | Device on: no error |
| Green <br> Slow blink | x1 | Receive data |
|  | x2 | Printhead overheated |
|  | x3 | Paper end |
|  | x4 | Voltage error |
|  | x5 | Cover open |
| Green <br> Fast blink | x1 | RAM error (*) |
|  | x 1 | EEPROM error (*) |
|  | x1 | Auto cutter error (*)(**) |
|  | x1 | Command not recognized |
|  | x 1 | Command reception time out |

(*): A buzzer beep is also associated.
(**): When auto cutter error is present, before printing a recover error procedure is performed (only one time). When auto cutter error, holding the feed button a recover procedure is performed.

The printer is also able to communicate its status to the host application if the application has been programmed to receive this information.

| For more information about | See this section |
| :--- | :--- |
| Error conditions and correcting them | "Troubleshooting the printer" in Appendix A, in <br> the User Guide |
| Communication of printer status to the host application | "Command descriptions" in Chapter 4: Program- <br> ming commands, Status sections. |

## Printer configuration

Printers are shipped with all the functions and parameters preset at the factory. Settings for various printer parameters can be changed. This menu is printed on the receipt and scrolls through instructions for selecting and changing any of the functions or parameters.

Caution: Be extremely careful changing any of the printer settings to avoid inadvertently changing other setting that might affect the performance of the printer.

The following functions and parameters can be changed in the scrolling configuration menu (except as noted):

- Communication Interfaces

Busy Condition
USB control

- Emulation/Software options

Print mode
Carriage return usage
Default font
Font size

- Hardware options

Print width
Print density
Paper threshold

## Configuring the printer by keys

The configuration menu allows you to select functions or change various settings for the printer. Instructions printed on the receipt guide you through the processes.

Caution: Be extremely careful changing any of the printer settings to avoid inadvertently changing other setting that might affect the performance of the printer.

1. Turn power off to printer.
2. Make sure receipt paper (1) is loaded in the printer before proceeding. Make sure cover is closed (2).
3. Connect the printer to power supply (3) and immediately press and hold the feed paper button (4) until the configuration printout begins.
4. To communicate with the printer, press the paper feed button. Use a short click of the feed button for modify parameters and keep hold the feed button to go to the next parameter. Follow the printed instructions to make selections.
5. Continue through your menu selections until the printer performs a total cut of the paper.

To print a setup report without turning off the printer, proceed as follows:

1. Open the cover (1).
2. Make sure receipt paper (2) is loaded in the printer before proceeding.
3. Press and hold the feed paper button (3).
4. Close the cover (4).
5. Press and hold the feed paper button (5) until the configuration printout begins.
6. To communicate with the printer, press the paper feed button. Use a short click of the feed button for modify parameters and keep hold the feed button to go to the next parameter. Follow the printed instructions to make selections.
7. Continue through your menu selections until the printer performs a total cut of the paper.

## Configuring the printer by software

The setup parameters can be set by using the "Cu4HPTool" software tool.

Caution: Be extremely careful changing any of the printer settings to avoid inadvertently changing other setting that might affect the performance of the printer.

1. Connect the device to a PC directly without using HUB devices.
2. Start "Cu4HPTool" software tool.
3. Click on LOAD > From Device and select the device connected to the PC.
4. Click on SETUP to access the operating parameters of the device to be configured.
5. Make the desired changes to the device operating parameters.
6. Click on SAVE > To Device to make the changes made effective.

## Communication interface settings

To change the communication interface settings enter the configuration menu and follow the instructions printed on the setup receipt or use the "Cu4HPTool" software tool.

Caution: Be extremely careful changing any of the printer settings to avoid inadvertently changing other setting that might affect the performance of the printer.

| Component | Description |  |
| :---: | :---: | :---: |
| Busy Condition | Activation mode for the Busy signal: |  |
|  | OffLine/ RxFull = | Busy signal is activated when the device is both in OffLine status and the buffer is full |
|  | RxFull ${ }^{\text {D }}=$ | Busy signal is activated when the buffer is full |
| USB Class | USB communication class definition. |  |
|  | Printer ${ }^{\text {D }}=$ | setting the printer function |
|  | Virtual COM = | setting the USB port as a serial port |
| USB Address Number | Numerical address code for the univocal identification of the USB device (in case of more than a USB device connected with the same PC): |  |
|  | 00123456789 |  |

## Printer settings and functions

To change the printer settings and functions enter the configuration menu and follow the instructions printed on the setup receipt or use the "Cu4HPTool" software tool.

Caution: Be extremely careful changing any of the printer settings to avoid inadvertently changing other setting that might affect the performance of the printer.

| Drawer signal | Drawer signal management: |  |
| :--- | :--- | :--- |
|  | Normal ${ }^{\mathrm{D}}=$ <br> Invert $=$ | Drawer signal active with high signal <br> Drawer signal active with low signal |
| Thai Printing Mode | Thai font management:1-pass <br>  <br> 3-pass |  |

## Chapter 3: Programming the Printer

## Overview of commands

Commands control all operations and functions of the printer. This includes selecting the size and placement of characters and graphics on the receipt to feeding and cutting the paper. The programming commands have been organized, in order of hexadecimal code within functional group. For this reason, "related" commands may not be listed adjacent to one another.

## Character appearance

The appearance of text can be changed using the following print modes:

- Standard
- Rotated
- Underlined
- Bold
- Double wide
- Reverse
- Italic
- Strike-through
Bold
- Upside-down

## Width specifications

- Characters per inch: 15
- Characters per line: 44
- Cell size: $13 \times 24$ dots (default font)
$18 \times 24$ dots
$10 \times 24$ dots

## Print zones

## Print zones for $\mathbf{8 0} \mathbf{~ m m}$ paper

Specifications of print zone for 80 mm paper:

- 576 dots (addressable) @ 8 dots/mm, centered on 80 mm
- Top margin to knife cut: 9 mm (0.35 inches)

## Rotated printing commands

Two commands control the rotation of printing. The table shows the combinations of set/cancel upside down print and set/cancel rotated print (clockwise).
The samples of the print show only the normal-size characters. Double-wide and double-high characters are printed in the same orientation. They may also be mixed on the same line.

| Upside down (1B 7B n) | Rotated CW (1B 56 n) | Resulting output |
| :---: | :---: | :---: |
| Canceled | Canceled | A B C |
| Canceled | Set | $\rightarrow$ - |
| Set | Canceled | $\forall$ |
| Set | Set | « |

## Chapter 4: Programming Commands

## Command listed by function

| Printer actions |  |  |
| :--- | :--- | ---: |
| Code (hexadecimal) | Command | Page |
| 1B 3D $n$ | Select peripheral device | 22 |
| 1B 40 | Initialize device | 23 |
| 1B $6335 n$ | Enable or disable panel buttons | 23 |
| 1B 69 | Total cut | 23 |
| 1B 6 D | Partial cut | 23 |
| 1B 70 n p1 p2 | Generate pulse to open cash drawer | 24 |
| 1D 56 m or 1D 56 mn | Select cut mode and cut paper (or code 1D 56 m$)$ | 24 |

## Print and paper feed

| Code (hexadecimal) | Command | Page |
| :--- | :--- | ---: |
| OA | Print and feed paper one line | 25 |
| OD | Print and carriage return | 25 |
| 1B 4A $n$ | Print and feed paper | 25 |
| 1B $64 n$ | Print and feed $n$ lines | 25 |

| Vertical and horizontal positioning |  |  |
| :--- | :--- | ---: |
| Code (hexadecimal) | Command | Page |
| 08 | Back space | 26 |
| 09 | Horizontal tab | 26 |
| 1B $24 n \mathrm{nH}$ | Set absolute print position | 26 |
| 1B $2876 n \mathrm{nH}$ | Set relative vertical print position | 27 |
| 1B 30 | Set vertical line spacing to 1/8 inch | 27 |
| 1B 32 | Set vertical line spacing to 1/6 inch | 27 |
| 1B $33 n$ | Set vertical line spacing | 28 |
| 1B $44 n 1 \ldots n k 00$ | Set horizontal tab positions | 28 |
| 1B $5 C n 1 n 2$ | Set relative print position | 29 |
| 1B $61 n$ | Select justification | 30 |
| $1 D 4 C n L n H$ | Set left margin | 30 |
| 1D $50 \times y$ | Set horizontal and vertical minimum motion units | 31 |
| 1D $57 n \mathrm{nLH}$ | Set printing area width | 31 |

| Text characteristics |  |  |
| :---: | :---: | :---: |
| Code (hexadecimal) | Command | Page |
| 1B20 $n$ | Set right-side character spacing | 33 |
| 1B21n | Select print mode | 34 |
| 1B 25 n | Enable or disable user-defined characters | 35 |
| 1B 26 y c1 cn x1[d0...dk] ...xn[d0...dk] | Define user-defined characters | 35 |
| 1B2D $n$ | Select or cancel underline mode | 36 |
| 1B34 n | Select or cancel italic print | 36 |
| 1B3F n | Cancel user-defined characters | 37 |
| 1B45 n | Select or cancel emphasized mode | 37 |
| 1B47 $n$ | Select or cancel double-strike | 38 |
| 1B4D $n$ | Select character font | 38 |
| 1B $52 n$ | Select an international character set font | 39 |
| 1B 56 n | Select or cancel 90 degree clockwise rotated print | 39 |
| 1B74n | Select character code table | 40 |
| 1B7B $n$ | Select or cancel upside-down print mode | 41 |
| 1BC1 $n$ | Select character pitch | 42 |
| 1C25n | Select the font type | 42 |
| 1C26 | Enable Kanji characters | 43 |
| 1C2E | Disable Kanji characters | 43 |
| 1C74 n | Thai font management | 43 |
| 1D $21 n$ | Select character size | 44 |
| 1D $42 n$ | Select or cancel white/black reverse print mode | 45 |
| Graphics |  |  |
| Code (hexadecimal) | Command | Page |
| 1B 2A m nL nH d1...dk | Select bit image mode | 46 |
| 1C504100 | Erase all logos | 47 |

## Command conventions

The following information describes how each command is organized:

| Name: | Name of command. |
| :--- | :--- |
| ASCII: | The ASCII control code. |
| Hexadecimal: | The hexadecimal control code. |
| Decimal: | The decimal control code. |
| Value: | A description of the command operands. |
| Range: | The upper and lower limits of the command operand. |
| Default: | The command operand default after printer reset. |
| Description: | Brief description and summary of the command. |
| Formulas: | Any formulas used for this command. |
| Exceptions: | Describes any exceptions to this command; for example, incompatible commands. |
| Related information: | Describes related information for this command; for example, bit information. |

## Command descriptions

## Printer actions

The printer function commands control the following basic printer functions and are described in order of their hexadecimal codes:

- Resetting the printer
- Cutting the paper
- Opening the cash drawers

| Select peripheral device |  |
| :--- | :--- |
| ASCII | ESC $=n$ |
| Hexadecimal | 1 B 3D $n$ |
| Decimal | $2761 n$ |
|  |  |
| Value of $n:$ | $1,3=$ Device enabled |
|  | $2=$ Device disabled |
| Default: | 1 (Enabled) |
| Related information |  |

When the device is disabled by this command, it ignores all transmitted data until the device is re-enabled by the same command.

| Initialize device | ESC @ |
| :--- | :--- | :--- |
| ASCII  <br> Hexadecimal 1B 40 <br> Decimal 2764 <br> Default: Character pitch: 15 CPI <br>  Column width: 44 characters <br> Character set: Code Page 437 <br>  Printing position: Column One |  |

Clears the print line buffer and resets the device to the default settings for the start-up configuration (refer to Default settings above). Data in the receive buffer is not cleared, and printing position moves to the beginning of the line.
Single-wide, single-high, non-rotated and left-aligned characters are set, and user-defined characters or logo graphics are cleared. (Flash memory and macros are not affected.) Tabs reset to default. Barcode settings reset. Page mode settings are cleared, and printer is set to standard mode.

| Enable or disable panel buttons |  |
| :--- | ---: |
| ASCII | ESC c $5 n$ |
| Hexadecimal | 1 B $6335 n$ |
| Decimal | $279953 n$ |

Value of $\boldsymbol{n}: \quad 0=$ Enable
1 = Disable
(When 0 and 1 are the least significant bit, LSB)

Range of $\boldsymbol{n}: \quad 0-255$
Default: 0 (Enable)

## Related information

When the panel buttons is disabled, the buttons may only be used after the device has been reset.

| Total cut |  |
| :--- | :--- |
| ASCII | ESC i |
| Hexadecimal | 1 B 69 |
| Decimal | 27105 |

This command enables auto cutter operation and executes a total cut.

## Related information

The device waits to complete all paper movement commands before it executes a total cut.

| Partial cut |  |
| :--- | :--- |
| ASCII | ESC m |
| Hexadecimal | 1 B 6D |
| Decimal | 27109 |

This command enables auto cutter operation and executes a partial cut.

## Related information

The device waits to complete all paper movement commands before it executes a partial cut.

| Generate pulse to open cash drawer |  |
| :--- | :---: |
| ASCII | ESC $n p 1 p 2$ |
| Hexadecimal | 1 B $70 n p 1 p 2$ |
| Decimal | $27112 n p 1 p 2$ |
|  |  |
| Value of $\boldsymbol{n}:$ | $00,48=$ Cash drawer 1 |
|  | $01,49=$ Cash drawer 2 |
| Value of p1: | $0-255$ |
| Value of $p 2:$ | $0-255$ |
| Sends a pulse to open the cash drawer. |  |
|  |  |
| Formulas |  |

The value for either $p 1$ or $p 2$ is the hexadecimal number multiplied by 2 msec to equal the total time.

- On-time = p1 (Hex) x 2 msec
- $\quad$ Off-time $=p 2$ (Hex) $x 2$ msec

## Related information

Off-time is the delay before the printer performs the next operation. Refer to cash drawer specifications for required on and off-time. If $p 2<p 1$, the off-time is equal to the on-time.

| Select cut mode and cut paper |  |  |
| :--- | :---: | :--- |
| ASCII | GS $\vee m$ | GS $V m n$ |
| Hexadecimal | $1 D 56 m$ | 1D 56 mn |
| Decimal | 2986 m | 2986 mn |

Value of $\boldsymbol{m}: \quad$ Selects the mode as shown in the table.

Value of $\boldsymbol{n}: \quad$ Determines cutting position only if $m$ is 65 or 66.

| $\mathbf{m}$ | Feed and cut mode |
| :---: | :---: |
| 0,48 | Total cut |
| 1,49 | Partial cut |
| 65 | Feeds paper to cutting postion + ( $n$ times vertical motion unit), and cuts the paper completely |
| 66 | Feeds paper to cutting position $+(n$ times vertical motion unit $)$, and performs a partial cut |
| Range of $\boldsymbol{m}:$ | 0,$48 ; 1,49$ |
| Range of $\boldsymbol{n}:$ | $0-255$ |
| Default of $\boldsymbol{m}, \boldsymbol{n}:$ | 0 |

Selects a mode for cutting paper and cuts the paper. There are two formats for this command, one requiring one parameter $m$, the other requiring two parameters $m$ and $n$. The format is indicated by the parameter $m$.

## Formulas

$n$ times the vertical motion unit is used to determine the cutting position to which the paper is fed. Set $n$ to 0 to cut below the last printed line.

## Print and paper feed

The print and feed commands control printing on the receipt and paper feed by the printer.

| Print and feed paper one line |  |
| :--- | :---: |
| ASCII | LF |
| Hexadecimal | 0 A |
| Decimal | 10 |

Prints one line from the buffer and feeds paper one line.

Carriage return/line feed pair prints and feeds only one line.

| Print and carriage return |  |
| :--- | ---: |
| ASCII | CR |
| Hexadecimal | OD |
| Decimal | 13 |

Prints one line from the buffer and feeds paper one line. The printer can be set through the configuration menu to ignore or use this command. Some applications expect the command to be ignored while others use it as print command.

## Related information

See ignoring/using the carriage return in Diagnostics for more information.

Carriage return/line feed pair prints and feeds only one line.

| Print and feed paper |  |
| :--- | :--- |
| ASCII | ESC J $n$ |
| Hexadecimal | 1 B 4A $n$ |
| Decimal | $2774 n$ |
| Value of $\boldsymbol{n}:$ | $n / 203$ inch |
| Range of $\boldsymbol{n}:$ | $0-255$ |

Prints one line from the buffer and feeds the paper $n / 8 \mathrm{~mm}$ ( $n / 203$ inch). The line height equals the character height when n is too small.

If the set horizontal and vertical minimum motion units command (1D 50) is used to change the horizontal and vertical minimum motion units, the parameters of this command (print and feed paper) will be interpreted accordingly.

## Related information

For more information, see the description of the set horizontal and vertical minimum motion units command in this document.

| Print and feed $\boldsymbol{n}$ lines |  |
| :---: | :---: |
| ASCII | ESC d $n$ |
| Hexadecimal | 1B64 n |
| Decimal | $27100 n$ |
| Range of $n$ : | 1-255 (0 is interpreted as 1) |

Prints one line from the buffer and feeds paper $n$ lines at the current line height.

## Vertical and horizontal positioning

The horizontal positioning commands control the horizontal print positions of characters on the receipt.
The command describe operation for 80 mm paper.

| Back space |  |
| :--- | :--- |
| ASCII | BS |
| Hexadecimal | 08 |
| Decimal | 8 |

Moves print position to previous character. This command can be used to put two characters at the same position.

| Horizontal tab |  |
| :--- | :--- |
| ASCII | HT |
| Hexadecimal | 09 |
| Decimal | 9 |

Moves the print position to the next tab position set by the set horizontal position (1B $44 n 1 n 2 \ldots .00$ ) command. The print position is reset to column one after each line.

Tab treats the left margin as column one, therefore changes to the left margin will move the tab positions.
When no tabs are defined to the right of the current position or if the next tab is past the right margin, line feed is executed. HT has no effect in page mode. If underline is set, tab spaces skipped by this command are not underlined.

Print initialization sets 32 tabs at column 8, 16, 24....

| Set absolute print position |  |
| :--- | ---: |
| ASCII | ESC $\$ \mathrm{~nL} \mathrm{nH}$ |
| Hexadecimal | 1 B 24 nL nH |
| Decimal | 2736 nL nH |

Value of $n$ : $\quad n=$ Number of dots to be moved from the beginning of the line.
$n \mathrm{~L}=$ Remainder after dividing $n$ by 256.
$n H=$ Integer after dividing $n$ by 256 .

The values for $n \mathrm{~L}$ and $n \mathrm{H}$ are two bytes in low byte, high byte word orientation.

Sets the print starting position to the specified number of dots (up to the right margin) from the beginning of the line. The print starting position is reset to the first column after each line.

## Formulas

The example shows how to calculate 280 dots as the absolute starting position.

```
28\times10= 280 dots (beginning of column 29)
280/256= 1, remainder of 24
nL = 24 nH= 1
```

## Related information

If the set horizontal and vertical motion units command (1D 50) is used to change the horizontal and vertical minimum motion unit, the parameters of the set relative print position command will be interpreted accordingly. For more information, see the description of the command set horizontal and vertical minimum motion units command (1D 50) in this document.

| Set relative vertical print position |  |
| :--- | :--- |
| ASCII | ESC $(v \mathrm{~nL} \mathrm{nH}$ |
| Hexadecimal | 1 B 2876 nL nH |
| Decimal | 2743118 nL nH |
| Range of $\boldsymbol{n L}:$ | $0-255$ |
|  |  |
| Range of $\boldsymbol{n H}:$ | $0-255$ |

Sets the print vertical position based on the current position by using the horizontal or vertical motion unit. This command sets the distance from the current position to [ $(n \mathrm{~L}+n \mathrm{H} \times 256) \times$ horizontal or vertical motion unit].

## Related information

When the starting position is specified by N motion unit to the bottom: $n \mathrm{~L}+n \mathrm{H} \times 256=\mathrm{N}$.
When the starting position is specified by N motion unit to the top (negative direction), use the complement of 65536: nL + nH $\times 256=65536-\mathrm{N}$.
If the set horizontal and vertical motion units command (1D 50) is used to change the horizontal and vertical minimum motion unit, the parameters of the set relative print position command will be interpreted accordingly. For more information, see the description of the command set horizontal and vertical minimum motion units command (1D 50) in this document.

| Set vertical line spacing to $\mathbf{1 / 8}$ inch |  |
| :--- | :---: |
| ASCII | ESC 0 |
| Hexadecimal | 1 B 30 |
| Decimal | 2748 |
|  |  |
| Default: | 3.33 mm ( 0.13 inch) |

Sets the default line spacing to 3.33 mm (1/8 of an inch).
This is set independently of the vertical motion unit (see 1D 50 xy ).
Set vertical line spacing to $\mathbf{1 / 6}$ inch

| ASCII | ESC 2 |
| :--- | :--- |
| Hexadecimal | 1 B 32 |
| Decimal | 2750 |

Default: $\quad 3.33 \mathrm{~mm}$ ( 0.13 inch)

Sets the default line spacing to 4.25 mm (1/6 of an inch).

This is set independently of the vertical motion unit (see 1D 50 x y).

| Set vertical line spacing |  |
| :--- | :--- |
| ASCII | ESC $3 n$ |
| Hexadecimal | 1 B $33 n$ |
| Decimal | $2751 n$ |
| Range of $\boldsymbol{n}:$ | $0-255$ |
| Default: | 3.33 mm (0.13 inch) |

Sets the line spacing to $n / 16 \mathrm{~mm}$ ( $n / 406$ inch). Note: sending 1 B 32 will overwrite this setting.

The minimum line spacing is 8.5 lines per inch. The line spacing equals the character height when $n$ is too small.

If the set horizontal and vertical minimum motion units command (1D 50) is used to change the horizontal and vertical minimum motion unit, the parameters of this command (set line spacing) will be interpreted accordingly.

| Set horizontal tab positions |  |
| :--- | :--- |
| ASCII | ESC D $n 1 \ldots n k$ NUL |
| Hexadecimal <br> Decimal | 1 B $44 n 1 \ldots n k 00$ |
| Value of $n:$ | $2768 n 1 \ldots n k 0$ |
| Range of $n:$ | 1 - number of columns in selected pitch |
|  | $0-32$ (decimal) |
| Default: | $\mathrm{n}=8,16,24,32, \ldots$ (Every eight characters for the default font set) |

Sets a horizontal tab to $n$ columns from the beginning of the line, where $k$ indicates the number of horizontal tab positions to be set.

The horizontal tab position is stored as a value of [character width $x n$ ], measured from the beginning of the line. The character width should be set before using this command. The setting of the horizontal tab positions will not be changed if the character width is changed after sending this command.

A maximum of 32 horizontal tab positions can be set. Data exceeding 32 horizontal tab positions are processed as normal data.

This command cancels any previous horizontal tab settings.
$n 1-n k$ should be listed in ascending order, followed by a 00. 1B 4400 changes all horizontal tab positions back to their default positions.

Horizontal tab position settings are effective until the printer is reset, the power is turned off, or a 1B 40 command is sent.

Print position advances to the next tab position on receipt by a 09h.

The horizontal tab position is affected by changes to the left margin.

| Set relative print position |  |
| :--- | :--- |
| ASCII | ESC $\backslash n 1 n 2$ |
| Hexadecimal | 1 B 5 C n1 n2 |
| Decimal | $2792 n 1 n 2$ |

Value of $n$ :

To move the relative starting position right of the current position:
$n=$ Number of dots to be moved right of the current position
n1 = Remainder after dividing $n$ by 256
n2 $=$ Integer after dividing $n$ by 256
The values for $n 1$ and $n 2$ are two bytes in low byte, high byte word orientation.

To move the relative starting position left of the current position:
$n=$ Number of dots to be moved left of the current position
$n 1=$ Remainder after dividing (65536-n) by 256
n2 $=$ Integer after dividing (65536-n) by 256

The values for $n 1$ and $n 2$ are two bytes in low byte, high byte word orientation.

Moves the print starting position the specified number of dots either right (up to the right margin) or left (up to the left margin) of the current position. The print starting position is reset to the first column after each line.

## Related information

If the set horizontal and vertical minimum motion units command (1D 50) is used to change the horizontal and vertical minimum motion unit, the parameters of this command (set relative print position) will be interpreted accordingly. In page mode, upper left or lower right uses the horizontal motion unit, and upper right or lower left uses the vertical motion unit. For more information, see the description of the set horizontal and vertical minimum motion units command (1D 50) in this document.

If underline is set, spaces skipped by this command are not underlined.

| Select justification |  |
| :--- | :--- |
| ASCII | ESC a $n$ |
| Hexadecimal | 1 B $61 n$ |
| Decimal | $2797 n$ |
|  |  |
| Value of $n:$ | $0,48=$ Left aligned |
|  | $1,49=$ Center aligned |
|  | $2,50=$ Right aligned |

Range of $\boldsymbol{n}: \quad 0-2,48-50$
Default: $0=$ Left aligned

Specifies the alignment of characters, graphics, logos, and bar codes on the receipt station in the print area specified by 1D 4C and 1D 57 according to the above table, until the printer is initialized, reset, or powered off. This justifies an entire line.

| Set left margin |  |
| :---: | :---: |
| ASCII | GS L $n \mathrm{~L} \mathrm{nH}$ |
| Hexadecimal | 1D 4C nL nH |
| Decimal | 2976 nL nH |
| Range of $\boldsymbol{n L}$ : | 0-255 |
| Range of nH : | 0-255 |
| Default: | 576 dots (the maximum printable area) |
| Formulas |  |

Sets the left margin of the printing area until the printer is initialized, reset, or powered off. The left margin is set to $((n H \times 256)+n L)$ times horizontal motion unit) inches. The horizontal motion units are set by the set horizontal and vertical minimum motion units command (1D 50), described in this manual. If the horizontal motion unit is changed after changing left margin, the left margin setting is not changed.

The width of the printing area is set by the set printing area width command (1D 57), which follows this command. See the set printing area width command in this document for a description of that command.

If the setting exceeds the printable area, the maximum value of the printable area is used. The maximum printable area is 576 dots. See the illustration.

To set the left margin to one inch at the default horizontal motion unit of 1/203 inches, send the four-byte string:

$$
\text { GS L } 2030
$$

Or, to set the left margin to two inches at the default horizontal motion unit of 1/203 units per inch, send the four-byte string:

GSL150 1
Where 2 inches $=406 / 203$, and $406=(1 \times 256)+150$.

## Exceptions

The command is effective only at the beginning of a line. This command is ignored if the line buffer is not empty.
If this command is processed in page mode, left margin is not changed until the printer is returned to standard mode.

| Set horizontal and vertical minimum motion units |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ASCII | GS Pxy |  |  |  |  |
| Hexadecimal | 1D50xy |  |  |  |  |
| Decimal | $2980 x y$ |  |  |  |  |
| Value of $x$ : | Horizontal | Range of $x$ : | 0-255 | Default of $x$ : | 203 |
| Value of $\boldsymbol{y}$ : | Vertical | Range of $y$ : | 0-255 | Default of $x$ : | 203 |

Sets the horizontal and vertical motion units to $1 / x$ inch and $1 / y$ inch respectively, until the printer is initialized, reset, or powered off.

When $x$ or $y$ is set to 0 , the default setting for that motion unit is used. When combined with other commands, the calculated result is truncated to the minimum value of the mechanical pitch.

| Mode | Command using $\mathbf{x}$ | Command using $\mathbf{Y}$ |
| :---: | :---: | :---: |
| Standard | 1B 20, 1B 24, 1B 5C, 1D 4C, 1D 57 | 1B 33, 1B 4A, 1D 56 |
| Page (upper left or lower right) | 1B 20, 1B 24, 1B 57, 1B 5C | 1B 33, 1B 4A, 1D 24, 1D 56, 1D 5C |
| Page (upper right or lower left) | 1B 33, 1B 4A, 1B 57, 1D 24, 1D 5C | 1B 20, 1B 24, 1B 57, 1B 5C, 1D 56 |
| Set printing area width |  |  |
| ASCII GS W nL nH |  |  |
| Hexadecimal 1D 57 nL nH |  |  |
| Decimal 2987 nL nH |  |  |
| Range of $n L: \quad 0-255$ |  |  |
| Range of $\mathbf{n H}: \quad 0-255$ |  |  |
| Default: 576 dots (the | maximum printable area) |  |

Sets the width of the printing area until the printer is initialized, reset, or powered off. If the setting exceeds the printable area, the maximum value of the printable area is used. If the left margin and printing area set the width to less than the width of a single character, the width is extended to accommodate the character for the line. The width of the printing area is set to ( $n \mathrm{nHX} 256$ ) $+n \mathrm{~L}$ ) times horizontal motion unit) inches. The horizontal motion units are set by the set horizontal and vertical minimum motion units command (1D 50). If the horizontal motion unit is changed after changing printing area width, the printing area width setting is not changed.

The width of the printing area follows the set left margin command (1D 4C). See the set left margin command (1D 4C ...) earlier in this document for a description.

## Formulas

To set the width of the printing area to one inch at the default horizontal motion unit of $1 / 203$ inches, send the four-byte string:

GS W 2030

Or, to set the width of the printing area to two inches at the default horizontal motion unit of 1/203 units per inch, send the four-byte string:

GS W 1501

Where 2 inches $=406 / 203$, and $406=(1 \times 256)+150$.

## Exceptions

The command is effective only at the beginning of a line.
If the setting exceeds the printable area, the maximum value of the printable area is used. The maximum printable area is 576 dots. See the illustration.

If this command is processed in page mode, left margin is not changed until the printer is returned to standard mode.

## Text characteristics

These commands control what the printed information looks like, selection of character sets, definition of customdefined characters and settings of margins. The commands are described in order of their hexadecimal codes.

The commands describe operation for 80 mm paper.

| Set right-side character spacing |  |
| :--- | :--- |
| ASCII | ESC SP $n$ |
| Hexadecimal 1 B $20 n$ <br> Decimal $2732 n$ <br> Range of $n:$ $0-32$ (decimal) <br> Default: 0 |  |

The units of horizontal and vertical motion are specified by the set horizontal and vertical minimum motion units (1D 50 ...) command. Changes in the horizontal or vertical units do not affect the current right side character spacing. When the horizontal or vertical motion unit is changed by the set horizontal and vertical minimum motion units (1D 50 ...) command the value must be in even units and not less than the minimum amount of horizontal movement.

In standard mode the horizontal motion unit is used.

In page mode the horizontal or vertical motion unit differs and depends on the starting position of the printable area. When the starting printing position is the upper left or lower right of the printable area (set by select print direction in page mode, 1B $54 n$ ) the horizontal motion unit ( $x$ ) is used. When the starting printing position is the upper right or lower left of the printable area (set by select print direction in page mode, 1B $54 n$ ) the vertical motion unit $(y)$ is used.

This command can be set independently in standard mode and in page mode.

When characters are enlarged, the right-side character spacing is a multiple of its normal value (ex. spacing for double-width mode is twice the normal value).

## Related information

This command does not affect HRI characters.

| Select print mode |  |
| :--- | :--- |
| ASCII | ESC!n |
| Hexadecimal | 1 B $21 n$ |
| Decimal | $2733 n$ |
|  |  |
| Value of $n:$ | Pitch selection (standard, double high or double wide) |

## Value of $n$ :

| Bit $^{\mathbf{1}}$ | Function |
| :--- | :---: |
| Bit 0 | Font selection |
| Bit 1 | Strike-through mode |
| Bit 3 | Emphasized mode |
| Bit 4 | Double high |
| Bit 5 | Double wide |
| Bit 6 | Italic mode |
| Bit 7 | Underlined mode |

${ }^{1}$ Bits 1, 2 are not used

## Default: $\quad 0$ (for bits $0,3,4,5,6,7$ )

| Bit 0 | Font selection | $\mathbf{1 1 / 1 5} \mathbf{c p i}$ | $\mathbf{1 5 / 2 0} \mathbf{c p i}$ | $\mathbf{2 0 / 2 5} \mathbf{c p i}$ |
| :---: | :---: | :---: | :---: | :---: |
| Off | Font A selected | $18 \times 24$ | $13 \times 24$ | $10 \times 24$ |
| On | Font B selected | $14 \times 24$ | $10 \times 24$ | $8 \times 24$ |

Selects the print mode: standard, emphasized, underlined, italic, double-high, or double-wide until the printer is initialized, reset, or powered off.
When double-height mode is enabled for some characters on a line, all characters are aligned on the baseline. When double-width mode is enabled, characters are enlarged to the right, starting from the left side of the character.

## Exceptions

This command does not affect HRI characters.

## Related information

In standard mode, when double-height mode is selected, the character is enlarged in the paper feed direction, and when double-width mode is selected it is enlarged perpendicular to the paper feed direction. In $90^{\circ}$ clockwiserotated mode, the relationship between double-height and double-width is reversed. In page mode, double-height and double-width are on the character orientation.

The bits in this command perform the same function as the stand-alone functions:

| 1B C1 n | Select pitch |
| :--- | :--- |
| 1B 45 n | Emphasized |
| 1B 47 n | Double-strike |
| 1B 2D n | Underline |
| 1D 21 n | Double high/Double wide |

| Enable or disable user-defined characters |  |
| :---: | :---: |
| ASCII | ESC \% n |
| Hexadecimal | 1B25 n |
| Decimal | 2737 n |
| Value of $\boldsymbol{n}$ : | 0 (bit 0) not selected |
|  | 1 (bit 1) selected |
|  | (When 0 and 1 are the least significant bit, LSB) |
| Range of $\boldsymbol{n}$ : | 0-255 |
| Default: | 0 (0ff) |
| Enables or dis | user-defined character set. |

## Related information

Only the Least Significant Bit (LSB) of $n$ is applicable.
When the user-defined character set is disabled, the internal character set is automatically selected.

| Define user- | racters |
| :---: | :---: |
| ASCII | ESC \& y c1 cn x1[d0...dk] ... xn[d0. dk] |
| Hexadecimal | 1B 26 y c1 cn x1[d0...dk] ... xn[d0. dk] |
| Decimal | 2738 y c1 cn x1[d0...dk] ... xn[d0. dk] |

## Values and range:

$y=3$, the number of bytes (vertically) in the character cell
$\mathrm{c}=\mathrm{c} 1$ specifies the start character code and cn specifies the final character code of the characters map area
c1 = Hex 20-7E
cn = Hex 20-7E

To define only one character, use the same code for both c1 and cn.
$\mathrm{k}=\mathrm{cn}-\mathrm{c} 1+1=$ the number of characters to be defined in this command string
$x=$ the width of the character to be replaced
$x=$ Hex 0-12 (font 18x24)
$x=$ Hex 0-0E (font 14x24)
$x=$ Hex 0-0A (font 10x24)
$x=$ Hex 0-8 (font $8 x 24$ )
d0. $\mathrm{dk}=0-255=$ the dot data for the characters.
The dot pattern is in the horizontal direction starting from the left. Any remaining dots on the right remain blank.

## Related information

It is possible to define multiple characters for consecutive character codes
if $\mathrm{cn}<\mathrm{c} 1$, the command is not executed.
The data to define a user-defined character is ( $\mathrm{x} \times \mathrm{y}$ ) bytes.
To print a dot, set the corresponding bit to 1 ; to not have it print, set to 0 .
This command can define different user-defined character patterns for each font.

## Formulas

To replace only the " $A$ " character of the 11 cpi font table (font $18 \times 24$ ), the command sequence is:
$0 \times 1 \mathrm{~B} 0 \times 260 \times 030 \times 410 \times 410 \times 10$ [48 bytes of the new character definition].

To replace " $A$ " and " $B$ " characters of the 11 cpi font table (font $18 \times 24$ ), the command sequence is:
$0 \times 1$ B $0 \times 260 \times 030 \times 410 \times 420 \times 10$ [48 bytes of the new character definition] $0 \times 10$ [48 bytes of the new character definition].

| Select or cancel underline mode |  |
| :--- | :--- |
| ASCII | ESC $-n$ |
| Hexadecimal | 1 B 2D $n$ |
| Decimal | $2745 n$ |
|  |  |
| Value of $n:$ | $0,48=$ Cancel underline mode |
|  | $1,49=$ Select underline mode |
|  | $2,50=$ Select double thickness underline mode |
|  |  |
|  | $0=$ Cancel underline mode |

Turns underline mode on or off until the printer is initialized, reset, or powered off. Underlines cannot be printed for spaces set by the horizontal tab, set absolute start position, or set relative print position commands. Underline thickness grows as the vertical size of the character grows.

This command and the Select Print Mode(s) command (1B 21) turn underline on and off in the same way.

## Exceptions

This command is ignored if $n$ is out of the specified range.

This command does not affect HRI characters.

The device cannot underline $90^{\circ} / 270^{\circ}$ rotated characters and white/black inverted characters.

| Select or cancel italic print |  |
| :--- | :--- |
| ASCII | ESC $4 n$ |
| Hexadecimal | 1 B $34 n$ |
| Decimal | $2752 n$ |
|  |  |
| Value of $n:$ | $0,48=$ Cancel italic print |
|  | $1,49=$ Select italic print |
|  |  |
| Default: | $0=$ Cancel italic mode |

Turns italic print on or off until the printer is initialized, reset, or powered off. Italics cannot be printed for spaces set by the horizontal tab, set absolute start position, or set relative print position commands.

This command and the Select Print Mode(s) command (1B 21) turn italic on and off in the same way.

## Exceptions

This command is ignored if $n$ is out of the specified range.

| Cancel user-defined character |  |
| :--- | :--- |
| ASCII | ESC ? $n$ |
| Hexadecimal | 1 B 3 F $n$ |
| Decimal | $2763 n$ |
| Value of $\boldsymbol{n}:$ | Specified character code |
| Range of $\boldsymbol{n}:$ | $32-126$ |

Cancels the pattern defined for the character code specified by n . After the user-defined character is canceled, the corresponding pattern from current active ROM code page is printed.

User-defined characters can be cancelled for each pitch independently by selecting the pitch using the 1B 21 command.

## Exceptions

This command is ignored if $n$ is out of the specified range.

| Select or cancel emphasized mode |  |
| :--- | :--- |
| ASCII | ESC E $n$ |
| Hexadecimal <br> Decimal | 1 B $45 n$ <br> $2769 n$ |
| Value of $\boldsymbol{n}:$ | 0 (bit 0) not selected <br> 1 (bit 1) selected <br> (When 0 and 1 are the least significant bit, LSB) |
|  | $0-255$ |
| Range of $\boldsymbol{n}:$ | 0 (Off) |

Starts or stops emphasized printing until the printer is initialized, reset, or powered off.

## Exceptions

Only the lowest bit of $n$ is effective. Emphasized printing cannot be used with bit-images or downloaded bit-images.

This command does not affect HRI characters.

## Related information

This command and the select print mode(s) command (1B 21) function identically. They should have the same setting when used together.

| Select or cancel double-strike |  |
| :--- | :--- |
| ASCII | ESC G $n$ |
| Hexadecimal <br> Decimal | 1 B $47 n$ <br> $2771 n$ |
| Value of $\boldsymbol{n}:$ | 0 (bit 0) not selected <br> 1 (bit 1) selected <br> (When 0 and 1 are the least significant bit, LSB) |
| Range of $\boldsymbol{n}:$ | $0-255$ |
| Default: | 0 (0ff) |

Turns double-strike mode on or off until the printer is initialized, reset, or powered off. Identical to emphasized mode.

## Exceptions

Only the lowest bit of n is effective. The settings do not apply in page mode. However they can be set or cleared in page mode.

Double-strike printing cannot be used with bit-images or downloaded bit-images.

This command does not affect HRI characters.

## Related information

This command and the select print mode(s) command (1B 21) function identically. They should have the same setting when used together.

| Select character font |  |
| :--- | :--- |
| ASCII | ESC M $n$ |
| Hexadecimal | 1B 4D $n$ |
| Decimal | $2777 n$ |

Value of $\boldsymbol{n}: \quad 0,1,48,49$

Selects characters font depending on cpi value set (Char/Inch) as follows:

| Char/Inch | $\mathbf{n}$ | Function |
| :---: | :---: | :---: |
| A $=11 \mathrm{cpi}$ | 0,48 | Font $11 \mathrm{cpi}(18 \times 24)$ |
| $=15 \mathrm{cpi}$ | 1,49 | Font $15 \mathrm{cpi}(14 \times 24)$ |
| A $=15 \mathrm{cpi}$ | 0,48 | Font $15 \mathrm{cpi}(14 \times 24)$ |
| $\mathrm{B}=20 \mathrm{cpi}$ | 1,49 | Font $20 \mathrm{cpi}(10 \times 24)$ |
| A $=20 \mathrm{cpi}$ | 0,48 | Font $20 \mathrm{cpi}(10 \times 24)$ |
| B $=25 \mathrm{cpi}$ | 1,49 | Font $25 \mathrm{cpi}(8 \times 24)$ |

| Select an international character set font |  |
| :--- | :--- |
| ASCII | ESC R $n$ |
| Hexadecimal | 1 B $52 n$ |
| Decimal | $2782 n$ |
| Range of $n:$ | $0-255$ |
| Default: | 0 |

Selects the international character set n according to the table below:

|  | HEX | 23 | 24 | 40 | 5B | 5C | 5D | 5E | 60 | 7B | 7 C | 7D | 7E |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| n (Hex) | Character Set |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 | U.S.A. | \# | \$ | @ | [ | 1 | ] | $\wedge$ | , | \{ | 1 | \} | $\sim$ |
| 1 | France | \# | \$ | à | - | ç | § | $\wedge$ | - | é | ù | è | " |
| 2 | Germany | \# | \$ | § | Ä | 0 O | Ü | $\wedge$ | - | ä | ö | ü | B |
| 3 | United Kingdom | £ | \$ | @ | [ | 1 | ] | $\wedge$ | - | \{ | 1 | \} | ~ |

| 33 | WPC1257- Baltic Rim |
| 34 | WPC1258-Vietnamese |
| FF | Space page |

[^0]Selects the character set to be used until the printer is initialized, reset, or powered off.

The tables are selectable only if the code pages are present on the machine. By selecting a code page not present on the machine, the code page remains the one currently in use.

Make sure to select the font type "International" with the command (1C25) or with the "Font type" parameter during the setup procedure (see the User Guide).

| Select or cancel upside-down print mode |  |
| :--- | :--- |
| ASCII ESC $\{n$ <br> Hexadecimal $1 \mathrm{~B} \mathrm{7B} n$ <br> Decimal $27123 n$ |  |
| Value of $n:$ | 0 (bit 0) not selected <br> 1 (bit 1) selected <br> (When 0 and 1 are the least significant bit, LSB) |
| Range of $\boldsymbol{n}:$ | $0-255$ |
| Default: | 0 (Off) |

Prints upside-down characters until the printer is initialized, reset, or powered off. The command may be combined with clockwise rotated print (1B 56).

## Exceptions

The command is valid only at the beginning of a line. It cannot be used with right side up characters on the same line.

| Select character pitch |  |
| :--- | :--- |
| ASCII | ESC 0xC1 n |
| Hexadecimal | 1BC1 $n$ |
| Decimal | $27192 n$ |

## Value of $n$ :

$0,48=$ Font $A=11 \mathrm{cpi}$, Font $B=15 \mathrm{cpi}$
$1,49=$ Font $A=15 \mathrm{cpi}$, Font $B=20 \mathrm{cpi}$
$2,50=$ Font $A=20 \mathrm{cpi}$, Font $\mathrm{B}=25 \mathrm{cpi}$

## Default: 0

| Select the font type |  |
| :--- | :--- |
| ASCII | FS $\% n$ |
| Hexadecimal | $1 C 25 n$ |
| Decimal | $2837 n$ |

## Value of $n$ :

0 = International
1 = Chinese GB18030
2 = Korean PC949
3 = Chinese BIG5

## Default: 0

## Related information

The selection made by this command is stored in the RAM memory. Turning off the device reverts to the default value, which can be set with the "Font type" parameter during the setup procedure (see User Guide).

After selecting the font type "International" it must be selected the desired character code table using the command 1B 74.

| Enable Kanji characters |  |
| :--- | :--- |
| ASCII |  |
| Hexadecimal | 1C 26 |
| Decimal | 2838 |

## Related information

This command can be used only for the Simplified Chinese (GB2312), Traditional Chinese (BIG5) or Extended Chinese (GB18030-2000).
This command enables Kanji fonts in RAM. Does not intervene on the parameter set-up.

| Disable Kanji characters |  |  |
| :--- | :---: | :---: |
| ASCII | FS |  |
| Hexadecimal | 1C 2E |  |
| Decimal | 2846 |  |

## Related information

This command can be used only for the Simplified Chinese (GB2312), Traditional Chinese (BIG5) or Extended Chinese (GB18030-2000).
This command enables Kanji fonts in RAM. Does not intervene on the parameter set-up.
Disabling the use of Kanji fonts will restore the codepage previously used.

| Thai font management |  |
| :--- | :--- |
| ASCII | FS t $n$ |
| Hexadecimal | $1 C 74 n$ |
| Decimal | $28116 n$ |

## Value of $n$ :

0 = 1-pass
1 = 3-pass

## Default: <br> 0

## Related information

This command allows the management of the KU42 single line.

| Select character size |  |
| :--- | :--- |
| ASCII | GS $!n$ |
| Hexadecimal | $1 D 21 n$ |
| Decimal | $2933 n$ |

Value of $\boldsymbol{n}: \quad 1-8=$ vertical number of times active font
$1-8=$ horizontal number of times active font

Range of $\boldsymbol{n}: \quad 00-07,10-77, \ldots, 70-77$

Bits 0 to 3: to select character height.
Bits 4 to 7: to select character width.

| Hex | Width | Hex | Height |
| :---: | :---: | :---: | :---: |
| 00 | 1 (normal) | 00 | 1 (normal) |
| 10 | 2 (width $=2 \mathrm{x}$ ) | 01 | 2 (height $=2 \mathrm{x}$ ) |
| 20 | 3 (width = 3x) | 02 | 3 (height $=3 \mathrm{x}$ ) |
| 30 | 4 (width $=4 x$ ) | 03 | 4 (height $=4 \mathrm{x}$ ) |
| 40 | 5 (width = 5x) | 04 | 5 (height = 5x) |
| 50 | 6 (width $=6 x$ ) | 05 | 6 (height $=6 \mathrm{x}$ ) |
| 60 | 7 (width = 7x) | 06 | 7 (height $=7 \mathrm{x}$ ) |
| 70 | 8 (width $=8 \mathrm{x}$ ) | 07 | 8 (height $=8 \mathrm{x}$ ) |

This command is effective for all characters (except for HRI characters) and is effecitve until the printer is initialized, reset, or powered off.

In standard mode, the vertical direction is the paper feed direction, and the horizontal direction is perpendicular to the paper feed direction. However, when character orientation changes in 90 degree clockwise-rotation mode, the relationship between vertical and horizontal directions is reversed.

In page mode, vertical and horizontal directions are based on the character orientation. When characters are enlarged with different sizes on one line, all the characters on the line are aligned at the baseline. When characters are enlarged width-wise, the characters are enlarged to the right, starting from the left side of the character.

The select print mode (1B 21 n ) command can also select or cancel double-width and double-height modes. However, the setting of the last received command is effective.

## Exceptions

If $n$ is out of the defined range, this command is ignored.

| Select or cancel white/black reverse print mode |  |
| :---: | :---: |
| ASCII | GS B n |
| Hexadecimal | 1D 42 n |
| Decimal | 2966 n |
| Value of $\boldsymbol{n}$ : | 0 (bit 0) not selected |
|  | 1 (bit 1) selected |
|  | (When 0 and 1 are the least significant bit, LSB) |
| Range of $\boldsymbol{n}$ : | 0-255 |
| Default: | 0 (0ff) |

Turns on white/black reverse print mode. In white/black reverse print mode, print dots and non-print dots are reversed, which means that white characters are printed on a black background. When the white/black reverse print mode is selected it is also applied to character spacing which is set by right-side character spacing (1B 20).

This command can be used with built-in characters and user-defined characters, but does not affect the space between lines.

White/black reverse print mode does not affect bit image, downloaded bit image, bar code, HRI characters, and spacing skipped by horizontal tab (09), set absolute starting position (1B 24 ...), and set relative print position (1B5C).

White/black reverse print mode has a higher priority than underline mode. When underline mode is on and white/ black reverse print mode is selected, underline mode is disabled, but not canceled.

Bar codes, logos, and bit images are not affected by this command.

## Exceptions

Only the lowest bit of $n$ is valid.

## Graphics

These commands are used to enter and print graphics data and are described in order of their hexadecimal codes, unless otherwise noted.

These commands describe operation for 80mm paper.

| Select bit image mode |  |
| :--- | :--- |
| ASCII ESC * $m \mathrm{~nL} n \mathrm{H} d 1 \ldots . . d k$ <br> Hexadecimal $1 \mathrm{~B} 2 \mathrm{AmnLnH} \mathrm{d1...dk}$ <br> Decimal $2742 \mathrm{mnLnHd1} . . d k$. |  |

Value of $m$ :

| $\mathbf{m}$ | Mode | Vertical direction |  | Horizontal direction |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | N. Dots | Dpi | Dpi | N. Data (K) |
| 0 | 8 dots single density | 8 | 67 | 100 | $\mathrm{~nL}+\mathrm{nH} \times 256$ |
| 1 | 8 dots double density | 8 | 67 | 200 | $\mathrm{~nL}+\mathrm{nH} \times 256$ |
| 32 | 24 dots single density | 24 | 200 | 100 | $(\mathrm{~nL}+\mathrm{nH} \times 256) \times 3$ |
| 33 | 24 dots double density | 24 | 200 | 200 | $(\mathrm{~nL}+\mathrm{nH} \times 256) \times 3$ |

## Value of $n$ :

| Value of $\mathbf{n}$ (8-dot single) | Value of $\mathbf{n}$ (24-dot single) | Value of $\mathbf{d}$ |
| :---: | :---: | :---: |
| $n L+(256 \times n H)$ | $3 \times[n \mathrm{~L}+(256 \times n \mathrm{H})]$ | Number of bytes of data* |

[^1]
## Formulas

8-dot single-density $=n \mathrm{~L}+(256 \times n \mathrm{H})$
24-dot single-density $=3 \times[n L+(256 \times n H)]$

Sets the print resolution and enters one line of graphics data into the print buffer. Excess data is accepted but ignored. Any print command is required to print the data, after which the printer returns to normal processing mode. The bit image is not affected by emphasize, double-strike, underline, character size, reverse printing, or 90 rotation, but is affected by upside-down printing mode.
In page mode, a starting position of upper right or lower left results in rotated bit-image data printing. See the illustration for graphic representations of the bit image below.

24-Dot Single-Density Mode

| Erase all logos |  |
| :--- | :--- |
| ASCII | FS P A NUL |
| Hexadecimal | $1 C 504100$ |
| Decimal | 2880650 |

Erases all logos from the storage drive.

## Related information

If command is successful the device transmits the ACK ( $0 \times 06$ ), otherwise returns NACK.

| Load logo in .bmp format |  |
| :--- | :--- |
| ASCII | FS P D $n H n n n L$ Kc1 Kc2 drv szHH szHL szLH szLL d[1]...d[sz] |
| Hexadecimal | $1 \mathrm{C} 5044 \mathrm{nH} n \mathrm{nc}$ Kc1 Kc2 drv szHH szHL szLH szLL d[1]...d[sz] |
| Decimal | $288068 \mathrm{nH} n \mathrm{Kc}$ Kc1 Kc2 drv szHH szHL szLH szLL d[1]...d[sz] |

Value of $\mathbf{n H}, \mathbf{n L}$ : Identifies the 16-bit index of the logo.

Value of drv: Storage drive

Value of Kc1 Kc2: Kc1 and Kc2 2 bytes that indicate the Keycode.
Value of d[1] ...d[sz]: .bmp image data.

Default: $\quad d r v=0$

## Related information

Keycode is 2 byte optional data to identify loaded image; its content is free for the user to select as a progressive number, file CRC or else.
szHH, szHL, szLH and szLL 4 bytes that indicate the bmp dimension in bytes.
$s z=(s z H H \times 16777216)+(s z H L \times 65536)+(s z L H \times 256)+s z L L$ indicates the number of bytes in the logo ( 4 bytes expressed in hexadecimal notation).

The image size depends on the amount of available memory on the device that you get by using 1C 5046 command.

If command is not successful the device transmits the NACK ( $0 x 15$ ), otherwise returns ACK ( $0 x 06$ ) followed by 13 bytes as shown in the command 1C 5049.

Device does not perform any check on Keycode since it is just an identification number.

| Erase single logo |  |
| :--- | :--- |
| ASCII | FS P E nH nL |
| Hexadecimal | $1 \mathrm{C} \mathrm{5045nH} n$ |
| Decimal | $288069 \mathrm{nH} n \mathrm{~L}$ |
|  |  |
| Value of $\mathbf{n H}, \mathrm{nL}:$ | Identifies the 16-bit index of the logo. |
|  |  |
| Related information |  |

If command is successful the device transmits the ACK ( $0 \times 06$ ), otherwise returns NACK.

| Read the memory free space |  |
| :--- | :--- |
| ASCII | FS P F drv |
| Hexadecimal | 1C $5046 d r v$ |
| Decimal | $288070 d r v$ |

Value of drv: $\quad$ The storage drive. Its value must be $0 \times 00$.

Reads the free space size (amount of free memory of the storage drive).

## Related information

If command is not successful the device transmits the NACK ( $0 \times 15$ ), otherwise returns ACK ( $0 \times 06$ ) followed by 4 bytes that indicate the amount of free memory in bytes as follows:

| Byte | Function |
| :---: | :---: |
| 1st | freeHH |
| 2nd | freeHL |
| 3rd | freeLH |
| 4th | freeLL |

## Formulas

To calculate the free memory size in bytes ( 4 bytes expressed in hexadecimal notation) using this formula: free size $=($ freeHH $\times 16777216)+($ freeHL $\times 65536)+($ freeLH $\times 256)+$ freeLL

## Read a stored logo

| ASCII | FS PGnH nL |
| :--- | :--- |
| Hexadecimal | 1 C 5047 nH nL |
| Decimal | $288071 \mathrm{nH} n \mathrm{~L}$ |

Reads a logo specified by $(n \mathrm{H} \times 256)+n \mathrm{~L}$ number.

## Related information

If the transmission has been received correctly and the command is valid, the device returns ACK ( $0 \times 06$ ) character, followed by image data, otherwise returns NACK ( $0 \times 15$ ) character if the logo is not present.

| Read the information for a specific logo |  |
| :---: | :---: |
| ASCII | FS P InH nL |
| Hexadecimal | 1C50 49 nH nL |
| Decimal | 288073 nH nL |
| Value of n : | 16 bit index of the logo |
| Reads the information for a specific logo. |  |
| Related information |  |

If command is not successful the device transmits the NACK ( $0 \times 15$ ), otherwise returns ACK ( $0 \times 06$ ) followed by the following bytes:

| Byte | Function |  |
| :---: | :---: | :---: |
| 1st | ACK |  |
| 2nd | drv |  |
| 3rd | xDimH |  |
| 4th | xDimL |  |
| 5th | yDimH |  |
| 6th | yDimL |  |
| 7th | sizeHH |  |
| 8th | sizeHL |  |
| 9th | size LH |  |
| 10th | size LL |  |
| 11th | crcH |  |
| 12th |  |  |
| 13th | CrcL |  |
| 14th |  |  |

where:

- drv is the storage drive. Its value must be $0 \times 00$
- $x$ DimH and $x$ DimL specifies the dimension $X$ of logo $=(x D i m H \times 256)+x D i m L$
- $y$ DimH and yDimL specifies the dimension $Y$ of logo $=(y \operatorname{DimH} \times 256)+y \operatorname{DimL}$
- sizeHH, sizeHL, sizeLH and sizeLL specifies the 32 flag bit for RAW bitmap dimension
- crcH and crcL identifies the Cyclic Redundancy Check of bitmap data
- Kc1, Kc2 is the keycode

## Read the list of currently stored logos <br> ASCII FSPL <br> Hexadecimal 1C504C <br> Decimal 288076

Returns the indexes list of the stored logos.

## Formulas

If command is not successful the device transmits the NACK ( $0 \times 15$ ), otherwise returns ACK ( $0 \times 06$ ) followed by 2 bytes nH and nL that indicates the number of stored logos (2 bytes expressed in hexadecimal notation) and a list of indexes structured as follows:

|  |  |  |  |
| :---: | :---: | :---: | :---: |
| Index 1 |  |  | Index n |
| Index H[1] Index L[1] |  | Index H[n] Index L[n] |  |

| Read the number of stored logos |  |
| :--- | :---: |
| ASCII | FS P n nH nL |
| Hexadecimal | $1 C 504 \mathrm{nH} n \mathrm{~L}$ |
| Decimal | $288078 \mathrm{nH} n \mathrm{~L}$ |

Reads how many logos are loaded.

## Related information

It returns ACK ( $0 \times 06$ ) character, followed by a 2 bytes nH and nL that indicate the number of stored logos. This value is expressed as $[(n \mathrm{H} \times 256)+n \mathrm{~L}]$.

| Print a logo previously saved |  |
| :--- | :--- |
| ASCII | FS PP nH nL mr |
| Hexadecimal | 1 C 5050 nH nL m |
| Decimal | 288080 nH nL mr |

Value of $\mathbf{n H}, \mathbf{n L}: \quad$ Identifies the 16 -bit index of the logo.
Value of $\boldsymbol{m}: \quad$ The value of $m$ selects the mode as follows:
$0,48=$ Normal
1,49 = Double width
2,50 = Double height
3, 51 = Quadruple

Value of $\boldsymbol{r}$. Specifies the rotation as follows:
$0=0^{\circ}$
$1=90^{\circ}$
$2=180^{\circ}$
$3=270^{\circ}$

| Read the memory overall size |  |
| :--- | :---: |
| ASCII | FS P T drv |
| Hexadecimal | 1 C 5054 drv |
| Decimal | 288084 drv |

Value of drv: $\quad$ The storage drive. Its value must be $0 \times 00$.

Reads the total size of memory of the storage drive (area where it is possible store logos).
Default: Total memory 3 MB

## Related information

If command is not successful the device transmits the NACK ( $0 \times 15$ ), otherwise returns ACK ( $0 \times 06$ ) followed by 4 bytes that indicate the amount of free memory in bytes as follows:

| Byte | Function |
| :---: | :---: |
| 1st | freeHH |
| 2nd | freeHL |
| 3rd | freeLH |
| 4th | freeLL |

## Formulas

To calculate the total memory size in bytes (4 bytes expressed in hexadecimal notation) using this formula: total size $=($ totHH $\times 16777216)+($ totHL $\times 65536)+($ totLH $\times 256)+$ totLL

| Print NV bit image |  |
| :--- | :--- |
| ASCII | FS p n m |
| Hexadecimal | $1 C 70 \mathrm{~nm}$ |
| Decimal | 28112 nm |
|  |  |
| Value of $\boldsymbol{n}:$ | Number of the NV bit image |

## Value and range of $\boldsymbol{m}$ :

Prints a NV bit image $n$ using the mode specified by $m$. NV bit image means a bit image which is defined in a nonvolatile memory by 1C 71 and printed by 1C 70.

| $\mathbf{m}$ | Print mode |
| :---: | :---: |
| 0,48 | Normal |
| 1,49 | Double width |
| 2,50 | Double height |
| 3,51 | Quadruple |

## Related information

This command is not effective when the specified NV bit image has not been defined.

In standard mode, this command is effective only when there is no data in the print buffer.

This command is not affected by print modes (bold, underline, character size, white/black reverse printing, etc.), except upside-down printing mode.

If the printing area width set by 1D 4C and 1D 57 for the NV bit image is less than one vertical line, the following processing is executed only on the line in question. However, in NV bit image mode, one vertical line means 1 dot (one half dot for slip paper) in normal mode ( $\mathrm{m}=0 \times 00,0 \times 30$ ) and in double-height mode ( $\mathrm{m}=0 \times 02,0 \times 32$ ), and it means 2 dots (two half dots for slip paper) in double-width mode ( $\mathrm{m}=0 \times 01,0 \times 31$ ) and in quadruple mode ( m $=0 \times 03,0 \times 33$ ).

The printing area width is extended to the right in NV bit image mode up to one line vertically. In this case, printing does not exceed the printable area.

If the printing area width cannot be extended by one line vertically, the left margin is reduced to accommodate one line vertically.

If the downloaded bit image to be printed exceeds one line, the excess data is not printed.

This command feeds dots (for the height $n$ of the NV bit image) in normal and double-width modes, and (for the height $\mathrm{n} \times 2$ of the VN bit image) in double-height and quadruple modes, regardless of the line spacing specified by 1B 32 or 1B 33.

After printing the bit image, this command sets the print position to the beginning of the line and processes the data that follows as normal data.

In page mode, this command is effective only if $\mathrm{m}=0 \times 00$ or $0 \times 30$.

| Define NV bit image |  |
| :---: | :---: |
| ASCII | FS q $n(x \mathrm{~L} x \mathrm{H} y \mathrm{~L} y \mathrm{H} d 1 . . . d k) 1 \ldots(x \mathrm{~L} x \mathrm{H} y \mathrm{~L} y \mathrm{H} d 1 \ldots . . . d k)$ |
| Hexadecimal | $1 \mathrm{C} 71 n(x \mathrm{~L} x \mathrm{H}$ yL yH d1...dk) 1...(xL xH yL yH d1...dk) |
| Decimal | $28113 n$ (xL xH yL yH d1...dk) 1...(xL xH yL yH d1...dk) |
| Value of $\boldsymbol{n}$ : | Number of the NV bit image |
| Value and range of $x$ : | Hex $0-\mathrm{FF}=(x \mathrm{~L}+x \mathrm{H} \times 256) \times 8$ dots in the horizontal direction |
|  | Hex 0-3 (when $1 \leq(x L+x H \times 256) \leq 1023$ |
| Value and range of $\boldsymbol{y}$ : | Hex 0-1 $($ when $1 \leq(y L+y H \times 256) \leq 288=(y L+y H \times 256) \times 8$ dots in the vertical direction |
| Value of $d$ : | Bytes of data. Bit gets printed to 1 and not printed to 0 |
| Value of $\boldsymbol{k}$ : | $k=(x L+x H \times 256) \times(y L+y H \times 256) \times 8$ |
| Define the NV bit imag by 1C 71 and printed | specified by $n$. NV bit image means a bit image which is defined in a non-volatile memory 1C 70. |

## Related information

Frequent write command execution may cause damage the NV memory. Therefore, it is recommended to write the least possible in the memory and no more than 10 times per day.

This command cancels all NV bit images that have already been defined by this command. The device cannot redefine only one of several data definitions previously defined. In this case, all data needs to be sent again.

In page mode, this command is not effective.
When the amount of data exceeds the capacity left in the range defined by $x \mathrm{~L}, x \mathrm{H}, y \mathrm{~L}, y \mathrm{H}$, the device processes $x \mathrm{~L}, x \mathrm{H}, y \mathrm{~L}, y \mathrm{H}$ out of the defined range.

In the first group of NV bit images, when any of the parameter's $x \mathrm{~L}, x \mathrm{H}, y \mathrm{~L}, y \mathrm{H}$ is out of the definition range, this command is disabled.

In groups of NV bit images other than the first one, when the device processes $x \mathrm{~L}, \mathrm{xH}, y \mathrm{~L}, y \mathrm{H}$ out of the defined range, it stops processing this command and starts writing into the non-volatile images. At this time, NV bit images that have not been defined are disabled (undefined), but any NV bit images before that are enabled.

This command defines $n$ as the number of a NV bit image. Numbers rise in order from NV bit image 01H. Therefore, the first data group [xL $x H y \operatorname{yH} d 1 \ldots d k$ ] is NV bit image 01H, and the last data group [ $x \mathrm{~L} x \mathrm{H} y \mathrm{~L} y \mathrm{H} d 1 \ldots d k$ ] is NV bit image n . The total agrees with the number of NV bit images specified by command 1C 70.

A definition data of a NV bit image consists of $[x L x H y L y H d 1 . . . d k]$. Thefore, when only one NV bit image is defined, $\mathrm{n}=0 \times 01$.

The device processes a data group [ $x \mathrm{~L} x \mathrm{H} y \mathrm{~L} y \mathrm{H} d 1 \ldots . . d k$ ] once.

The device uses ([data: $(x \mathrm{~L}+x \mathrm{H} \times 256) \times(y \mathrm{~L}+y \mathrm{H} \times 256) \times 8]+$ [header :4]) bytes of non-volatile memory.
The definition area in this device is a maximum of 3 MB . This command can define several NV bit images but cannot define a bit image data whose total capacity [bit image data + header] exceeds 3 MB.

When this command is received during macro definition, the device ends macro definition, and begins executing this command.

Once a NV bit image is defined, it is not erased by executing 1B 40, reset, and power off.

| Define downloaded bit image |
| :--- |
| ASCII |
| GS * $x y d 1 \ldots d(x \times y \times 8)$ |
| Hexadecimal |
| Decimal |

Value and range of $x$ : Hex $1-\mathrm{FF}=$ Number of bytes in the horizontal direction

Value and range of $\boldsymbol{y}$ : Hex 1-30=Number of bytes in the vertical direction

Value of d: $\quad$ Bytes of data. Bit gets printed to 1 and not printed to 0
$x \times y \leq 1536$

Enters a downloaded bit image into graphic memory of the device with the number of dots specified by $x$ and $y$.

The number of bytes in horizontal and vertical directions ( $x$ and $y$ ) are the horizontal and vertical size of the starting image divided by 8.

The downloaded bit image is available until power is turned off or reset, another bit image is defined, or initialize printer (1B 40) command is received.

See the illustration below for a graphic representation of the downloaded bit image.

| Print downloaded bit image |  |
| :--- | :---: |
| ASCII | GS $/ m$ |
| Hexadecimal | 1D $2 \mathrm{~F} m$ |
| Decimal | 2947 m |

## Value and range of $\boldsymbol{m}$ :

This command is used to print a previously stored monochrome logo (defined by 1D 2A) from printer memory on the receipt station. The logo is identified as the one indicated by the most recent select current logo command or 0 if a select current logo command has not yet been given. Parameter $m$ is interpreted as follows:

| $\mathbf{m}$ | Print mode |
| :---: | :---: |
| 0 | Normal |
| 1 | Double width |
| 2 | Double height |
| 3 | Quadruple |

## Related information

The indexed downloaded bit image from RAM or flash will be printed on the receipt station at a size specified by m .

If doubling or quadrupling exceeds the print paper width maximums (576) the left side of the image is printed and the bits to the right of the maximum column are discarded.

If the available width is greater than the bit image, its printing will adhere to any currently set right, left, or center justification.

This command is ignored if the index refers to an undefined logo/ bit image.

In standard mode, this command is effective only when there is no data in the print buffer.

This command has no effect in the print modes bold, underline, character size, or white/black reverse printing), except for upside-down printing mode ( $180^{\circ}$ rotation).

If the printing area width set by 1D 4C and 1D 57 is less than one line in vertical, the following processing is performed only on the line in question:

1) The printing area width is extended to the right up to one line in vertical. In this case, printing does not exceed the printable area.
2) If the printing area width cannot be extended by one line in vertical, the left margin is reduced to accommodate one line in vertical.

| Print |  |
| :---: | :---: |
| ASCII | GS v $0 m x L x H y L y H d 1 . . . d k$ |
| Hexadecimal | 1D $7630 \mathrm{mxL} x \mathrm{HLL} y \mathrm{H} d 1 . . . d k$ |
| Decimal | $2911848 \mathrm{~m} \times \mathrm{L} \times \mathrm{H}$ yL yH d1...dk |

## Value and range of $\boldsymbol{m}$ :

Selects raster bit image mode. Parameter $m$ is interpreted as follows:

| $\mathbf{m}$ | Print mode |
| :---: | :---: |
| 0,48 | Normal |
| 1,49 | Double width |
| 2,50 | Double height |
| 3,51 | Quadruple |

Value and range of $x L, x H: \quad$| $0 x 00 \leq x L \leq 0 x F F$ |  |
| :--- | :--- |
|  | $0 x 00 \leq x H \leq 0 x F F(1 \leq x L+x H \times 256 \leq 65535)$ |

$x \mathrm{~L}, x \mathrm{H}$ selects the number of data bytes $(x \mathrm{~L}+x \mathrm{H} \times 256)$ in the horizontal direction for the bit image.

## Value and range of $\boldsymbol{y} \mathrm{L}, \boldsymbol{y} \mathrm{H}$ :

$0 \times 00 \leq y \mathrm{~L} \leq 0 \times \mathrm{FF}$ $0 \times 00 \leq y H \leq 0 \times 08(1 \leq y L+y H \times 256 \leq 2047)$
$y \mathrm{~L}, y \mathrm{H}$ selects the number of data bytes $(y \mathrm{~L}+y \mathrm{H} \times 256)$ in the vertical direction for the bit image.
Value and range of $\boldsymbol{k}: \quad \mathrm{k}=(\mathrm{xL}+\mathrm{xH} \times 256)+(\mathrm{yL}+\mathrm{yH} \times 256) \quad$ (except for $\mathrm{k}=0)$
$k$ shows the number of data of the image. It is an explanation parameter, so it is not necessary to transmit it.

Value and range of $d$ :
$0-255=$ data of the image.

## Related information

In standard mode for receipt paper, this command is effective only when there is no data in the print buffer.

The data (d) identify as 1 a printed bit and as 0 a non-printed bit.

If a raster bit image is longer than one line, the surplus data are not printed.

This command has no effect in all print modes (character size, bold, upside-down, underline, white/black reverse printing, etc.) for raster bit image, except the reverse mode ( $90^{\circ}$ anticlockwise rotation).

This command feed the paper as much as is necessary to print the raster bit image.

Do not use this command during a macro execution because it cannot be included in a
macro. After the printing, the printing position moves to the beginning of the line.
The following table shows the relationship between the downloaded bit image and the printed data:

| d1 | d2 | ... | dx |
| :---: | :---: | :---: | :---: |
| dX+1 | dX+2 | $\ldots$ | dX $\times 2$ |
| : | : | ... | : |
| ... | dk-2 | dk-1 | d |

## Status

These commands providing the status of the printer.

| Transmit printer serial number |  |
| :--- | :--- |
| ASCII | FS OxEA $n$ |
| Hexadecimal | 1CEA $n$ |
| Decimal | $28234 n$ |
|  |  |
| Value of $n:$ | $82,114=$ Transmit printer serial number |

## Related information

The serial number is a string of 16 alphanumeric characters.

If the printer serial number is not defined, the device returns a string of 16 characters with a value of $0 \times 00$.

| Transmit printer ID |  |
| :--- | :--- |
| ASCII | GS In |
| Hexadecimal | 1D $49 n$ |
| Decimal | $2973 n$ |

| Value of $n:$ | $1,49=$ Printer model ID (1 byte) |

|  | On | 02 | 2 | Enable user status |
| 2 | Off | 00 | 0 | Disable recoverable error status |
|  | On | 04 | 4 | Enable recoverable error status |
| 3 | Off | 00 | 0 | Disable unrecoverable error status |
|  | On | 08 | 8 | Enable unrecoverable error status |
| 4 | - | - | - | Undefined |
| 5 | - | - | - | Undefined |
| 6 | - | - | - | Undefined |
| 7 | - | - | - | Undefined |

## Related information

Once enable at least one byte of the full status, for each change of at least one of the bits which compose the required status, the status sent in automatic from the device will be so composed as follows:
1st Byte $=0 \times 10$ (DLE)
2nd Byte $=\mathrm{n}$

## Real time

The real time commands provide an application interface to the printer even when the printer is not handling other commands.

Three situations must be understood when using real time commands.

First, the printer executes the real time command within a few msec of detecting it in the input buffer and will transmit status regardless of the condition of the DSR signal.

Second, the printer transmits status whenever it recognizes a real time status transmission command sequence, even if that sequence happens to occur naturally within the data of another command, such as graphics data. In this case the sequence will also be handled correctly as the graphics data it is intended to be when the graphics command is executed from the buffer.

Third, care must be taken not to insert a real time command into the data sequence of another command that consists of two or more bytes.

In this case the printer will use the real time command sequence bytes instead of the other command's parameter bytes when finally executing that other command from the buffer; the other command will NOT be executed correctly.

| Real time status transmission |  |
| :--- | :--- |
| ASCII | DLE EOT $n$ |
| Hexadecimal | $1004 n$ |
| Decimal | $164 n$ |
|  |  |
| Value of $n:$ | $1=$ Transmit printer status |
|  | $2=$ Transmit off-line status |
|  | $3=$ Transmit error status |
|  | $4=$ Transmit paper roll sensor status |
|  | $17=$ Transmit print status |
|  | $20=$ Transmit full status |
|  | $21=$ Transmit printer ID |

Transmits the selected one byte printer status specified by n in real time according to the following parameters.

## Exceptions

The command is ignored if $n$ is out of range.

## 21 = Transmit printer ID

Refer to command 1D 49
Reading length of paper available before virtual paper-end
ASCII

| GS 0xE1 |  |
| :--- | :--- |
| Hexadecimal | 1D E1 |
| Decimal | 29225 |

The command returns a string indicating how much paper is available.

## Related information

The length of residual paper reported is just as an indication because tolerances and other factors are not taken into consideration (paper thickness, roll core diameter, roll core thickness).

The virtual paper-end limit is set by the command 1D E6.

To set virtual paper-end limit, measure the length of the paper from low paper to the end of the roll, using several of them.

| Reading number of cuts performed by the auto cutter |
| :--- |
| ASCII GS OxE2 <br> Hexadecimal 1D E2 <br> Decimal 29226 |

The command returns a string indicating how many cuts are performed by the auto cutter.

| Reading length of printed paper |  |
| :--- | :---: |
| ASCII | GS 0xE3 |
| Hexadecimal | 1 E3 |
| Decimal | 29227 |

The command returns a string indicating how much paper is printed.

| Reading number of power up |  |
| :--- | :---: |
| ASCII | GS 0xE5 |
| Hexadecimal | 1D E5 |
| Decimal | 29229 |

The command returns a string indicating the number of device power ups.

## Bar codes

These commands format and print bar codes and are described in order of their hexadecimal codes.

These commands describe operation for 80mm paper.

## PDF 417 Overview

PDF 417 is a multi-row, continuous, variable length symbology which has high data capacity. Each symbol has between 3 and 20 rows, with each row containing a start pattern, a left row indicator, 1 to 30 data characters, a right row indicator and a stop pattern. The number and length of the rows are selectable, which allows the aspect ratio to be adjusted to particular labeling applications. There are no separator bars between rows.

Each character has four bars and four spaces within 8 modules and is assigned a value between 0 and 928 . For this symbology, it is common to refer to these character values as "code words."

There are three mutually exclusive sets of symbol patterns, or clusters, each having 929 distinct patterns. Because different clusters are used for adjacent rows, it is possible for the decoder to tell if the scanning path is crossing row boundaries without the use of separator bars.

## Sample symbol description:

Each PDF 417 symbol consists of 3 to 20 stacked rows surrounded on all four sides by a quiet zone. Each row contains:

The number of characters in a row and number of rows can be adjusted to vary the symbol's overall aspect ratio to best fit an available space.

Each row has a left and right row indicator with a data region between. The left-most character in the top row of the data region is the total number of characters in the data region, excluding error correction characters. Characters within the data region are designed to be read from left to right, starting on the top row, immediately after the length-defining character. The maximum characters in the data region are 928.

A series of seven commands are required to create and print QR codes.

| 1. Select number of columns | 1D 286 B 03003041 n |
| :--- | :--- |
| 2. Select number of rows | 1D 286 B 03003042 n |
| 3. Select width of module | 1D 286 B 03003043 n |
| 4. Select height of module | 1D 286 B 03003044 n |
| 5. Select error correction level | 1D 286 B 04003045 mn |
| 6. Store symbol data | 1D $286 \mathrm{~B} 0300305030 \mathrm{~d} 1 \ldots \mathrm{dk}$ |
| 7. Print symbol data | 1D 286 B 0300305130 |

$\mathrm{n}=0 \times 00$ specifies auto processing. When auto processing is specified, the maximum number of columns in the data area is 30 columns.

When n is not $0 \times 00$, specifies the number of columns of the data area as n code word.
The following data is not included in the number of columns:

- start pattern and stop pattern
- indicator code word of left and right

| Select number of rows for PDF 417 |  |
| :--- | :--- |
| ASCII | GS (k ETX NUL O B n |
| Hexadecimal | $1 D 286 B 03003042 \mathrm{n}$ |
| Decimal | 2940107304866 n |
| Value of $\mathrm{n}:$ | $3-20=$ Specifies the number of rows for PDF 417 bar code. |
| Default: | 0 |

## Related information

$\mathrm{n}=0 \times 00$ specifies auto processing. When auto processing is specified, the maximum number of rows is 20 .

When n is not $0 \times 00$, specifies the number of rows of the data area as n rows.

| Select width of a module of PDF 417 |  |
| :--- | :--- |
| GS (k ETX NUL O C n |  |
| ASCII | 1D 286 B 03003043 n |
| Hexadecimal | 2940107304867 n |
| Decimal | $2-8=$ Specifies the width of a module of PDF 417 barcode. |
| Value of $\mathrm{n}:$ | 3 |

Select height of a module of PDF 417

| ASCII | GS (k ETX NUL 0 D n |
| :--- | :--- |
| Hexadecimal | 1D $286 B 03003044$ n |
| Decimal | 2940107304868 n |

Value of $\mathrm{n}: \quad 2-8=$ Specifies the height of a module of PDF 417 barcode.
Default: 3

| Select error correction level for PDF 417 |  |  |
| :---: | :---: | :---: |
| ASCII | GS (kEOT NUL 0 E m n |  |
| Hexadecimal | 1D 28 6B 04003045 mn |  |
| Decimal | 2940107404869 mn |  |
| Values of m: | 48 = Error correction level specified by level |  |
| Value of n : | Function | No. of error correction code word |
| 30h | Selects Error correction level 0 | 2 |
| 31h | Selects Error correction level 1 | 4 |
| 32h | Selects Error correction level 2 | 8 |
| 33h | Selects Error correction level 3 | 16 |
| 34h | Selects Error correction level 4 | 32 |
| 35h | Selects Error correction level 5 | 64 |
| 36h | Selects Error correction level 6 | 128 |
| 37h | Selects Error correction level 7 | 256 |
| 38h | Selects Error correction level 8 | 512 |
| Values of m: | $49=$ Error correction level specified by ratio |  |

The error correction level is defined by the calculated value [number of data code word $\times \mathrm{n} \times 0.1=(\mathrm{A})$ ]. The number of the error correction code word is changeable in proportion to the number of the code words on the data area.

| Calculated value (A): | Function | No. of error correction code word |
| :--- | :--- | :--- |
| $0-3$ | Selects Error correction level 1 | 4 |
| $4-10$ | Selects Error correction level 2 | 8 |
| $11-20$ | Selects Error correction level 3 | 16 |
| $21-45$ | Selects Error correction level 4 | 32 |
| $46-100$ | Selects Error correction level 5 | 64 |
| $101-200$ | Selects Error correction level 6 | 128 |
| $201-400$ | Selects Error correction level 7 | 256 |
| $>400$ | Selects Error correction level 8 | 512 |

## Related information

This error correction allows the barcode to endure some damage without causing loss of data. The error correction level depends on the amount of data that needs to be encoded, the size and the amount of symbol damage that could occur.

| Stor | 417 |
| :---: | :---: |
| ASCII | GS ( k ETX NUL 0 P 0 d1...dk |
| Hexadecimal | 1D 28 6B 0300305030 d1...dk |
| Decimal | 294010730488048 d1...dk |

This command stores the PDF-417 symbol data (d1... dk ) in the symbol storage area.

PDF417 barcode only with ASCII characters:

$$
4 \leq(p L+p H \times 256) \leq 1112
$$

PDF417 barcode only with alphanumeric characters:

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 1854
$$

PDF417 barcode only with numeric characters:

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 2729 \quad(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 0 A)
$$

$(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 07)$

## Related information

k bytes of d1...dk are processed as barcode data.
Specify only the data code word of the barcode with this function. Be sure not to include the control data in the data d1...dk because they are added automatically by the device.

```
Print symbol data for PDF 417
ASCII GS(kETX NULOQO
Hexadecimal 1D 286B0300305130
Decimal 294010730488148
```

This command encodes and prints the PDF 417 symbol data in the symbol storage area, based on the settings in the previous commands.

In standard mode, use this function when printer is "at the beginning of a line," or "there is no data in the print buffer." The symbol size that exceeds the print area cannot be printed.

If there is any error described below in the data of the barcode save area, it cannot be printed.

- There is no data.
- If [(number of columns × number of rows) < number of code word] when auto processing is specified for number of columns and number of rows.
- Number of code word exceeds 928 in the data area.

Printing of symbol is not affected by print mode (emphasized, double-strike, underline, white/black reverse printing, or $90^{\circ}$ clockwise-rotated), except for character size and upside-down print mode.

When auto processing is specified, the number of columns is calculated by the current printing area, module width and the code word in the data area. Maximum number of the columns is 30 .

## QR Code Overview

QR code is a 2-dimensional matrix symbology consisting of an array of nominally square modules arranged in an overall square pattern using the QR symbology. A unique pattern at three of the symbol's four corners assists in determining the bar code size, position, and rotation.

A series of seven commands are required to create and print QR codes.

| 1. Select model for QR code | 1D 28 6B 04003141 n 1 n 2 |
| :---: | :---: |
| 2. Select QR Code barcode version | 1D 28 6B 03003142 n |
| 3. Set size for QR module | 1D 28 6B 03003143 n |
| 4. Select error correction level | 1D 28 6B 03003145 n |
| 5. Store symbol data | 1D 28 6B 0300315031 d1...dk |
| 6. Print symbol data | 1D 28 6B 0300315131 |
| 7. Transmit QR code print size | 1D286B0300315230 |

The details of each command are described below.

Note: The settings for model, size of module, and error correction level are effective until the printer is reset, or the power is turned off.

| Select model for QR Code |  |
| :---: | :---: |
| ASCII | GS (kEOT NUL 1 An1 n2 |
| Hexadecimal | 1D 28 6B 04003141 n 1 n 2 |
| Decimal | 2940107404965 n 1 n 2 |
| Value of n 1 : | $32 \mathrm{~h}=$ Selects model 2 (default) |
|  | 33h = Selects Micro Qr code |
| Value of n2: | 00h (default) |

## Related information

QRcode: Encode all extended ASCII characters data up to a maximum length of 7089 numeric digits, 4296 alphabetic characters or 2953 bytes of data.
MicroQR (a miniature version of the QRcode barcode for short message): Encode all numbers from 0 to 9 up to a maximum length of 35 characters.

| Select QR Code barcode version |  |

## Related information

f selected version has not enough capacity to store the saved amount of data, next smallest version capable of that capacity will be printed.
For QRcode version capacity according to ECC (Error Correction Capability) and data type refer to following table. With $\mathrm{n}=0 \times 00$ the selection of the version occurs automatically according to the one that allows the printing of the requested data.

| Set size for QR Code module |  |
| :--- | :--- |
| GS (kETX NUL 1 C n |  |
| ASCII | $1 D 286 B 03003143 \mathrm{n}$ |
| Hexadecimal | 2940107304967 n |
| Decimal | $02 \mathrm{~h} \leq \mathrm{n} \leq 18 \mathrm{~h}$ |
| Value of $\mathrm{n}:$ | 06 h |

Sets numbers of dots for each pixel of QRcode barcode.

| Select error correction level for QR Code |  |  |
| :---: | :---: | :---: |
| ASCII | GS (kETX NUL 1 En |  |
| Hexadecimal | 1D 28 6B 03003145 n |  |
| Decimal | 2940107304969 n |  |
| Value of n : | Function | Recovery Capacity \% |
| 30h | Selects Error correction level L | 7 |
| 31h | Selects Error correction level M | 15 |
| 32h | Selects Error correction level Q | 25 |
| 33h | Selects Error correction level H | 30 |

Note: QR Code employs Reed-Solomon error correction to generate a series of error correction words.

| Store symbol data for QR Code |  |
| :--- | :--- |
| ASCII | GS ( k ETX NUL 1 P 1 d1...dk |
| Hexadecimal | $1 D 286 B 0300315031 \mathrm{~d} 1 . . \mathrm{dk}$ |
| Decimal | $294010730498049 \mathrm{~d} 1 . . \mathrm{dk}$ |

This command stores the QR code symbol data ( $\mathrm{d} 1 . . . \mathrm{dk}$ ) in the symbol storage area.

QRcode barcode only with binary characters (8 bit):

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 2957 \quad(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 0 B)
$$

QRcode barcode only with alphanumeric characters:

$$
4 \leq(p L+p H \times 256) \leq 4300
$$

$(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 10)$
QRcode barcode only with numeric characters:

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 7093 \quad(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 1 \mathrm{~B})
$$

## Related information

k bytes of d1...dk are processed as barcode data.
Specify only the data code word of the barcode with this function.

| Print symbol data for QR Code |  |
| :--- | :--- |
| ASCII | GS ( k ETX NUL 1 Q 1 |
| Hexadecimal | 1D $286 B 0300315131$ |
| Decimal | 294010730498149 |

This command encodes and prints the QR code symbol data in the symbol storage area, based on the settings in the previous commands.

In standard mode, use this function when printer is "at the beginning of a line," or "there is no data in the print buffer." The symbol size that exceeds the print area cannot be printed.

If there is no data in storage, or if the data in the storage area is more than the data allowed by specified model and data compaction mode, the QR code cannot be printed.

Printing of symbol is not affected by print mode (emphasized, double-strike, underline, white/black reverse printing, or $90^{\circ}$ clockwise-rotated), except for character size and upside-down print mode.

In standard mode, this command executes paper feeding for the amount needed for printing the symbol, regardless of the paper feed amount set by the paper feed setting command, The print position returns to the left side of the printable area after printing the symbol, and printer is in the status "beginning of the line," or "there is no data in the print buffer."

In page mode, the printer stores the symbol data in the print buffer without executing actual printing. The printer moves print position to the next dot of the last data of the symbol.

A quiet zone of four times the size of one module is required on all sides of the QR code symbol, but it is not included in the printing data. Be sure to add a quiet zone when using this function.

| Transmit QR Code print size |  |
| :--- | :--- |
| ASCII | GS ( k ETX NUL 1 R 0 |
| Hexadecimal | 1D 28 6B 0300315230 |
| Decimal | 294010730498248 |

Transmits the size information for printing the QR symbol data stored by the store data command in the symbol storage area.

The size information for each data is as follows:

| Send Data | Hex | Data |
| :---: | :---: | :---: |
| Header | 37 | 1 byte |
| Identifier | 36 | 1 byte |
| Horizontal size $^{(1)}$ | $30-39$ | $1-5$ byte |
| Separator $^{\text {(1) }}$ | 1 F | 1 byte |
| Vertical size $^{(1)}$ | $30-39$ | $1-5$ byte |
| Separator | 1 F | 1 byte |
| Fixed value | 31 | 1 byte |
| Separator | 1 F | 1 byte |
| Other information ${ }^{(2)}$ | 30 or 31 | 1 byte |
| NUL | 00 | 1 byte |

(1) "Horizontal size" and "vertical size" indicate the number of dots of the symbol.

The values of the vertical size and horizontal size are converted to characters and sent starting from the high order end (ex: When horizontal size is 120 dots, horizontal size is $0 \times 310 \times 320 \times 30$, which is 3 bytes of data).
(2) "Other information" indicates whether printing of the data in the symbol storage area is possible or impossible. The "Other information" is the following:

| Hex | Condition |
| :---: | :---: |
| 30 | Printing is possible |
| 31 | Printing is impossible |

The quiet zone is not included in the size information.
If "other information" is "Printing is impossible"( $0 \times 31$ ), use one of the solutions shown below:

| Cause | Solution |
| :---: | :---: |
| There are data in the print buffer in the standard mode | Clear the data in the print buffer. |
| Symbol is bigger than the current print area. | Expand the print area. <br> Reduce the module size. <br> Lower the error correction level. |
| The data in the symbol storage area is too large. | Send correct data. <br> Lower the error correction level. |
| There is no data in the symbol storage area. | Send data to the symbol storage area. |

## Store symbol data for DataMatrix

| ASCII | GS (k ETX NUL Q P 3 d1...dk |
| :--- | :--- |
| Hexadecimal | 1D 286 B $0300515033 \mathrm{~d} 1 . . \mathrm{dk}$ |

Decimal 294010730818051 d1...dk

This command stores the DataMatrix symbol data (d1... dk) in the symbol storage area.
DataMatrix barcode only with ASCII characters (8 bit) :

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 1560 \quad(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 06)
$$

DataMatrix barcode only with alphanumeric characters:

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 2339 \quad(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 09)
$$

DataMatrix barcode only with numeric characters:

$$
4 \leq(\mathrm{pL}+\mathrm{pH} \times 256) \leq 3120 \quad(0 \times 00 \leq \mathrm{pL} \leq 0 \times F F, 0 \times 00 \leq \mathrm{pH} \leq 0 \times 0 C)
$$

## Related information

k bytes of $\mathrm{d} 1 . . . \mathrm{dk}$ are processed as barcode data.
Specify only the data code word of the barcode with this function. Be sure not to include the control data in the data d1...dk because they are added automatically by the device.

| Print symbol data for DataMatrix |  |
| :--- | :--- |
| ASCII | GS ( k ETX NUL Q Q 3 |
| Hexadecimal | 1D 286 B 0300515133 |
| Decimal | 294010730818151 |

This command encodes and prints the DataMatrix symbol data in the symbol storage area, based on the settings in the previous commands.

In standard mode, use this function when printer is "at the beginning of a line," or "there is no data in the print buffer." The symbol size that exceeds the print area cannot be printed.

If there is any error described below in the data of the barcode save area, it cannot be printed.

- There is no data.
- If [(number of columns × number of rows) < number of code word] when auto processing is specified for number of columns and number of rows.
- Number of code word exceeds 928 in the data area.

Printing of symbol is not affected by print mode (emphasized, double-strike, underline, white/black reverse printing, or $90^{\circ}$ clockwise-rotated), except for character size and upside-down print mode.

When auto processing is specified, the number of columns is calculated by the current printing area, module width and the code word in the data area. Maximum number of the columns is 30 .

| Select printing position of HRI characters |  |
| :---: | :---: |
| ASCII | GS H $n$ |
| Hexadecimal | 1D 48 n |
| Decimal | $2972 n$ |
| Value of $\boldsymbol{n}$ : | Printing position |
|  | $0=$ Not printed |
|  | 1 = Above the bar code |
|  | 2 = Below the bar code |
|  | 3 = Both above and below the bar code |
| Default: | 0 (Not printed) |

Prints HRI (human readable interface) characters above or below the bar code using the pitch specified by 1D 66. Setting is effective until the printer is initialized, reset, or powered off.

| Select font for HRI characters |  |
| :--- | :---: |
| ASCII | GS $\mathrm{f} n$ |
| Hexadecimal | 1 D $66 n$ |
| Decimal | $29102 n$ |
|  |  |
| Value of $n:$ | $0,48=$ Font A |
|  | $1,49=$ Font B |
|  |  |
| Default: | 0 (Not printed) |

Selects font for printing bar code characters using 1D 48 n.

| Select barcode height |  |
| :--- | :--- |
| ASCII GS $n$ <br> Hexadecimal $1 D 68 n$ <br> Decimal $29104 n$ |  |
| Value of $\boldsymbol{n}:$ Number of dots <br> Range of $\boldsymbol{n}:$ $1-255$ <br> Default: 162 <br> Sets the bar code height.  |  |

| Print bar code |  |  |
| :--- | :--- | :--- |
|  |  | First variation |
| ASCII | GS k $m[d 1 . . d k]$ NUL | GS k $m n[d 1 . . d n]$ |
| Hexadecimal | 1D 6B $m[d 1 . . d k] 00$ | 1D 6B $m n[d 1 . . d n]$ |
| Decimal | $29107 m[d 1 . . d k] 0$ | $29107 m n[d 1 . . d n]$ |
|  | $(0=$ End of command) |  |

Selects the bar code type and prints a bar code for the ASCII characters entered. If the width of the bar code exceeds one line, the bar code is not printed.

There are two variations to this command. The first variation uses a NUL character to terminate the string; the second uses a length byte at the beginning of the string to compensate for the code 128 bar code, which can accept a NUL character as part of the data. With the second variation, the length of byte is specified at the beginning of the string.

This command is not affected by print modes (bold, double-strike, underline, or character size), except for upsidedown and justification mode.

The check digit is calculated for UPC and JAN (EAN) codes if it is not sent from the host computer. Six-character zero-suppressed UPC-E tags are generated from full 11 or 12 characters sent from the host computer according to standard UPC-E rules. Start/stop characters are added for code 39 if they are not included.

## Related information

The command is only valid at the beginning of a line.
If d is outside of the specified range, the device prints the following message: "BARCODE GENERATOR IS NOT OK!" and processes the data which follows as normal data.
If the horizontal size exceeds the printing area, the device only feeds the paper.

## Values

First variation: String terminated with NUL character. Length $k$ is not specified in command string; it depends on the bar code being printed.

| $\boldsymbol{m}$ | Bar code | $\boldsymbol{d 1} . . \boldsymbol{d k}$ | Length |
| :---: | :---: | :---: | :---: |
| $\mathbf{0}$ | UPC-A | 48-57 (ASCII numerals) | Fixed length: 11,12 |
| $\mathbf{1}$ | UPC-E | $48-57$ | Fixed length: 11,12 |
| 2 | EAN13 (JAN) | $48-57$ | Fixed length: 12,13 |
| 3 | EAN8 (JAN) | $48-57$ | Fixed length: 7, 8 |

| CODE39 | $48-57,65-90$ (ASCII alphabet), <br> $32,36,37,43,45,46,47$ | Variable length |  |
| :---: | :---: | :---: | :--- |
| 5 | ITF | $48-57$ | Variable length (even number) |
| 6 | CODABAR | $48-57,65-68,36,43,45,46,47,58$ | Variable length |
| 7 | CODE93 | $1-127$ | Variable length |
| 8 | CODE128 | $1-127$ | Variable length |
| 20 | CODE32 | $48-57$ | Fixed length: 8,9 |

Second variation: Length $n$ specified at beginning of string. Except as noted, $0<n<25$.

| m | Bar code | d1...dk | Length |
| :---: | :---: | :---: | :---: |
| 65 | UPC-A | 48-57 (ASCII numerals) | Fixed length: 11, 12 |
| 66 | UPC-E | 48-57 | Fixed length: 11, 12 |
| 67 | EAN13 (JAN) | 48-57 | Fixed length: 12, 13 |
| 68 | EAN8 (JAN) | 48-57 | Fixed length: 7, 8 |
| 69 | CODE39 | $\begin{gathered} \text { 48-57, 65-90 (ASCII alphabet), } \\ 32,36,37,43,45,46,47 \end{gathered}$ | Variable length |
| 70 | ITF | 48-57 | Variable length (even number) |
| 71 | CODABAR | 48-57, 65-68, 36, 43, 45, 46, 47, 58 | Variable length |
| 72 | CODE93 | 1-127 | Variable length |
| 73 | CODE128 | 1-127 | Variable length |
| 75 | GS1 Databar | 48-57 | 13 |
| 76 | GS1 Databar Truncated | 48-57 | 13 |
| 77 | GS1 Databar Limited | $48-57$ <br> (however d1 $=48,49$ ) | 13 |
| 78 | GS1 Databar Expanded | $\begin{gathered} 48-57,65-90,97-122 \text {, } \\ 32-34,37-47,58-63,95,123 \text {, } \\ \text { (however } d 1=40,48 \leq d 2 \leq 57,48 \leq d 3 \\ \leq 57 \text { when } 48 \leq d 1 \leq 57,48 \leq d 2 \leq 57 \text { ) } \end{gathered}$ | Variable length |
| 90 | CODE32 | 48-57 | Fixed length: 8,9 |

The value of $m$ selects the bar code system as described in the table.
The variable dindicates the character code to be encoded into the specified bar code system. If character code d cannot be encoded, the printer prints the bar code data processed so far, and the following data is treated as normal data.

## Exceptions

When CODE93 is used:
The device prints an HRI character (o) as a start character at the beginning of the HRI character string.
The device prints an HRI character (o) as a stop character at the end of the HRI character string.
The device prints an HRI character ( n ) as a control character ( 0 to 31 and 127).

When CODE128 is used, please note the following regarding data transmission:
The top part of the barcode data string must be a code set selection character (CODE A, CODE B or CODE C) which selects the first code set.
Special characters are defined by combining two characters " [" and one character. ASCII character " $\{$ " is defined by transmitting "\{" twice, consecutively.

| Specific character | Data Transmission |  |
| :---: | :---: | :---: |
|  | ASCII | Hex |
| SHIFT | $\{S$ | $7 \mathrm{~B}, 53$ |
| CODE A | \{A | $7 \mathrm{~B}, 41$ |
| CODE B | $\{\mathrm{B}$ | $7 \mathrm{~B}, 42$ |
| CODE C | $\{\mathrm{C}$ | $7 \mathrm{~B}, 43$ |
| FNC1 | $\{1$ | $7 \mathrm{~B}, 31$ |
| FNC2 | $\{2$ | $7 \mathrm{~B}, 32$ |
| FNC3 | $\{3$ | $7 \mathrm{~B}, 33$ |
| FNC4 | $\{4$ | $7 \mathrm{~B}, 34$ |
| $\{‘$ | $\{\{$ | $7 B, 7 B$ |

When UPC-E is used, introducing the barcode characters, the device prints:

| Transmitted data |  |  |  |  |  |  |  |  |  |  | Printed Data |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| d1 | d2 | d3 | d4 | d5 | d6 | d7 | d8 | d9 | d10 | d11 |  |  |  |  |  |  |
| 0 | 0-9 | 0-9 | 0 | 0 | 0 | 0 | 0 | 0-9 | 0-9 | 0-9 | d2 | d3 | d9 | d10 | d11 | 0 |

| 0 | 0-9 | 0-9 | 2 | 0 | 0 | 0 | 0 | 0-9 | 0-9 | 0-9 | d2 | d3 | d9 | d10 | d11 | 2 |
| 0 | 0-9 | 0-9 | 3-9 | 0 | 0 | 0 | 0 | 0 | 0-9 | 0-9 | d2 | d3 | d4 | d10 | d11 | 3 |
| 0 | 0-9 | 0-9 | 0-9 | 1-9 | 0 | 0 | 0 | 0 | 0 | 0-9 | d2 | d3 | d4 | d5 | d11 | 4 |
| 0 | 0-9 | 0-9 | 0-9 | 0-9 | 1-9 | 0 | 0 | 0 | 0 | 5-9 | d2 | d3 | d4 | d5 | d6 | d11 |

| Select barcode width |  |
| :--- | :--- |
| ASCII | GS w $n$ |
| Hexadecimal | $1 D 77 n$ |
| Decimal | $29119 n$ |

Value of $\boldsymbol{n}: \quad 1,2,3,4,5,6$
Default: $\quad n=3$

Sets the bar code width to $n$ dots until the printer is initialized, reset, or powered off. If the barcode is too wide for the printing area, the barcode will not print.

## Formulas

## Page mode

Standard mode is typical of how most printers operate by printing data as it is received and feeding paper as the various paper feed commands are received. Page mode is different in that it processes or prepares the data as a "page" in memory before it prints it. Think of this as a virtual page. The page can be any area within certain parameters that you define. The page is printed using either the FF ( $0 C$ ) or the ESC FF (1B OC) command.

The select page mode command (1B4C) puts the printer into page mode. Any commands that are received are interpreted as page mode commands. Several commands react differently when in standard mode and page mode. The descriptions of these individual commands in this chapter indicate the differences in how they operate in the two modes.

These commands describe the operation for 80 mm paper.

## Print and return to standard mode from page mode <br> ASCII FF <br> Hexadecimal OC <br> Decimal 12

When printing is completed, values for select print direction in page mode (1B54 $n$ ) and set print area in page mode (1B $57 n 1, n 2, \ldots, n 8$ ) and the position for buffering character data are set. Buffered data is not deleted from the printer.

The processed data is printed, and the printer returns to standard mode. The developed data is deleted after being printed. For more information see page mode in this document.

## Exceptions

This command is enabled only in page mode.

| Cancel print data in page mode |  |
| :--- | :---: |
| ASCII | CAN |
| Hexadecimal | 18 |
| Decimal | 24 |

Deletes all the data to be printed in the "page" area. Any data from the previously selected "page" area that is also part of the data to be printed is deleted.

## Exceptions

This command is enabled only in page mode.

| Print data in page mode |  |
| :--- | ---: |
| ASCII | ESC FF |
| Hexadecimal | 1B OC |
| Decimal | 2712 |

Prints all buffered data in the printing area collectively.

After printing, the printer does not clear the buffered data and sets values for select print direction in page mode (1B $54 n$ ), print area in page mode (1B57) and the position for buffering character data.

## Exceptions

This command is enabled only in page mode.

| Select page mode |  |
| :--- | :--- |
| ASCII | ESC L |
| Hexadecimal | $1 B 4 C$ |
| Decimal | 2776 |

Switches from standard mode to page mode. After printing has been completed either by the print and return to standard mode (FF) command or select standard mode (1B 53) the printer returns to standard mode. The developed data is deleted after being printed.

This command sets the position where data is buffered to the position specified by select print direction in page mode (1B 54) within the printing area defined by set print area in page mode (1B 57).

This command switches the settings for the following commands (which values can be set independently in standard mode and page mode) to those for page mode:

- Set right-side character spacing (1B 20)
- Select $1 / 6$-inch line spacing (1B 32)
- Set line spacing (1B 33)

It is possible only to set values for the following commands in page mode. These commands are not executed.

- Select or cancel 90 degree clockwise rotation (1B 56)
- Select justification (1B 61)
- Select or cancel upside-down printing (1B 7B)
- Set left margin (1D 4C)
- $\quad$ Set print area width (1D 57)

Printer returns to standard mode through use of 1B 40 or initialization.

## Exceptions

The command is enabled only when input at the beginning of a line.
The command has no effect if page mode has previously been selected.

| Select standard mode |  |
| :--- | ---: |
| ASCII | ESC S |
| Hexadecimal | 1 B 53 |
| Decimal | 2783 |

Switches from page mode to standard mode. In switching from page mode to standard mode, data buffered in page mode are cleared, the printing area set by set print area in page (1B 57) is initialized and the print position is set to the beginning of the line.

This command switches the settings for the following commands (which values can be set independently in standard mode and page mode) to those for standard mode:

- Set right-side character spacing (1B 20)
- Select $1 / 6$-inch line spacing (1B 32)
- Set line spacing (1B 33)

Standard mode is automatically selected when power is turned on, the printer is reset or the initialize printer command (1B 40) is used.

1D 24 and 1D 5C commands are ignored in standard mode.

## Exceptions

This command is enabled only in page mode.

| Select print direction in page mode |  |
| :---: | :---: |
| ASCII | ESC ${ }^{\text {n }}$ |
| Hexadecimal | 1B54 n |
| Decimal | $2784 n$ |
| Value of $n$ : | Start position |
|  | $0=$ Upper left corner proceeding across page to the right [A] |
|  | 1 = Lower left corner proceeding up the page [B] |
|  | 2 = Lower right corner proceeding across page to the left (upside down) [C] |
|  | 3 = Upper right corner proceeding down page [D] |

## Default: 0

Selects the printing direction and start position in page mode. See the illustration below.

The command can be sent multiple times so that several different print areas, aligned in different print directions, can be developed in the printer's page buffer before being printed using the print page mode commands ( 0 C or 1B OC).

## Exceptions

This command is valid only in page mode.

The command is ignored if the value of $n$ is out of the specified range.

If this command is processed in standard mode, print direction is not changed until the printer is set to page mode.

| Set print area in page mode |  |
| :--- | :---: |
| ASCII | ESC $W n 1, n 2 \ldots . . n 8$ |
| Hexadecimal | 1 B $57 n 1, n 2 \ldots . . n 8$ |
| Decimal | $2787 n 1, n 2 \ldots . . n 8$ |

Range of $\boldsymbol{n}: \quad 0-255$

| Default: | $n 1-4=$ | 0 |
| :--- | :--- | :--- |
|  | $n 5=$ | 64 |
| $n 6=$ | 2 |  |
| $n 7=$ | 64 |  |
|  | $n 8=$ | 2 |
|  | $(576 \times 576$ for 80 mm paper $)$ |  |

Sets the position and size of the printing area in page mode until the printer is initialized, reset, or powered off, or a OC command is sent.

The command can be sent multiple times so that several different print areas, aligned in different print directions, can be developed in the printer's page buffer before being printed using the print page mode commands ( 0 C or 1B OC).

## Formulas

The starting position of the print area is the upper left of the area to be printed ( $x 0, y 0$ ). The length of the area to be printed in the $y$ direction is set to dy inches. The length of the area to be printed in the $x$ direction is set to dx inches. Use the equations to determine the Value of $\mathrm{x} 0, \mathrm{y} 0, \mathrm{dx}$ and dy .

- $x 0=[(n 1+n 2 \times 256) \times($ horizontal direction of the fundamental calculation pitch $)]$
- $y 0=[(n 3+n 4 \times 256) \times($ vertical direction of the fundamental calculation pitch) $]$
- $\mathrm{dx}=[(n 5+n 6 \times 256) \times($ horizontal direction of the fundamental calculation pitch $)]$
- $d y=[(n 7+n 8 \times 256) \times($ vertical direction of the fundamental calculation pitch $)]$

Keep the following notes in mind for this command.

- The fundamental calculation pitch depends on the vertical or horizontal direction.
- The maximum printable area in the $x$ direction is 576/203 inches.
- The maximum printable area in the $y$ direction is $576 / 203$ inches.

The horizontal and vertical motion unit are specified by 1D 50. Changing the horizontal or vertical motion unit does not affect the current printing area.

## Exceptions

This command is valid only in page mode.

If $[x 0+d x]$ is greater than the printable area, the printing area width is set to [horizontal printable area $-x 0$ ]. If $[y 0+y x]$ is greater than the printable area, the printing area height is set to [vertical printable area -y 0 ].

If the horizontal or vertical starting position is set outside the printable area, the device stops command processing and processes the following data as normal data.

If the printing area width or height is set to 0 , the device stops command processing and processes the following data as normal data.
Set absolute vertical print position in page mode

| ASCII | GS $\$ \mathrm{~nL} \mathrm{nH}$ |
| :--- | :--- |
| Hexadecimal | 1D $24 \mathrm{~nL} n \mathrm{H}$ |
| Decimal | $2936 \mathrm{~nL} n \mathrm{HH}$ | (

Sets the absolute vertical print starting position for buffer character data in page mode. The absolute print position is set to $[(n \mathrm{~L}+n \mathrm{H} \times 256) \times($ vertical or horizontal motion unit $)]$ inches.

The vertical or horizontal motion unit for the paper roll is used and the horizontal starting buffer position does not move.

The reference starting position is set by select print direction in page mode (1B 54). This sets the absolute position in the vertical direction when the starting position is set to the upper left or lower right and sets the absolute position in the horizontal when the starting position is set to the upper right or lower left. The horizontal and vertical motion unit are specified by the set horizontal and vertical minimum motion units (1D 50) command.

The set horizontal and vertical minimum motion units (1D 50) command can be used to change the horizontal and vertical motion unit. However, the value cannot be less than the minimum horizontal movement amount and it must be in even units of the minimum horizontal movement amount.

## Formulas

$[(n \mathrm{~L}+n \mathrm{H} \times 256) \times($ vertical or horizontal motion unit) $]$ inches.

## Exceptions

This command is valid only in page mode.

If the $[(n \mathrm{~L}+n \mathrm{H} \times 256) \times$ (vertical or horizontal motion unit)] exceeds the specified printing area, this command is ignored.

| Store graphics data in the print buffer in raster format |  |
| :---: | :---: |
|  | First variation |
| ASCII | GS ( L pL pH m fn a bx by cxL xH yL yH d1...dk |
| Hexadecimal | 1D 28 4C pL pH 307030 bx by cxL xH yL yH d1...dk |
| Decimal | 294076 pL pH 4811248 bx by cxL xH yL yH d1...dk |
|  | Second variation |
| ASCII | GS $8 \mathrm{~L} p 1 \mathrm{p} 2 \mathrm{p} 3 \mathrm{p} 4 \mathrm{~m}$ fn a bx by cxL xH yL yH d1...dk |
| Hexadecimal | 1D 38 4C p1 p2 p3 p4 307030 bx by cxL xH yL yH d1...dk |
| Decimal | 295676 p1 p2 p3 p4 4811248 bx by cxL xH yL yH d1...dk |
| Range | When using GS ( L: $11 \leq(p L+p H \times 256) \leq 32778$ ( $0 \leq p L \leq 255,0 \leq p H \leq 128)$ |
|  | When using GS 8 L: $11 \leq(p 1+p 2 \times 256+p 3 \times 65536+p 4 \times 16777216) \leq 32778$ |
|  | $0 \leq d \leq 255$ |
| Values | $m=48$ |
|  | $f n=112$ |
|  | $a=48$ |
|  | $c=49$ |
|  | $k=($ int $((x L+x H \times 256)+7) / 8) \times(y L+y H \times 256)$ |

Defines selected items of NV graphics data ( $d 1 . . . d k$ ) to the print buffer.
Users have the option of specifying horizontal (times bx) x vertical (times by) size settings for the selected data. $x L$ and $x H$ specify the horizontal size of NV graphics in units of dots ( $x L+x H x 256$ ).
$y L$ and $y H$ specify the vertical size of NV graphics in units of dots ( $y L+y H \times 256$ ).
Switch $d$ is used to specify the defined data for NV graphics. This data is processed as raster format.
Switch $k$ is used to indicate the defined data value. It is not necessary to send parameter $k$ because it is a descriptive parameter.

## Related information

Use this function when the printer enters the "beginning of the line" or "except for graphic data, no data in print buffer" state during the standard mode,
This function is incompatible with macros so make sure to avoid including it when defining macros.
NV graphics data that exceeds the print area for one line will not be printed.
The scales for width and height of graphics are specified by $(x, y)$. Therefore, in page mode with $90^{\circ}$ or $270^{\circ}$ clockwise-rotated graphics, the printer applies printing area and dot density from [x: direction of paper feed, $y$ : perpendicular to direction of paper feed].
Settings for text effect (bold, underline, orientation) and font size do not affect the printing of the NV graphics data. Print position does not change before and after this function is used.
The data for byte $k$ of $d 1$... $d k$ is processed as a single item of defined NV graphics data. The defined data (d) specifies " 1 " for bits corresponding to dots that will be printed and " 0 " for bits corresponding to dots that will not be printed.
During processing of this function, real time commands are not available.
The relationship between NV graphics data (raster format) and print result is shown in the table below

| $d 1$ | $d 2$ | $\ldots$ | $d X$ |
| :---: | :---: | :---: | :---: |
| $d x+1$ | $d x+2$ | $\ldots$ | $d x \times 2$ |
| $:$ | $:$ | $\ldots$ | $:$ |
| $\ldots$ | $d k-2$ | $d k-1$ | $d k$ |

$$
X=(x L+x H \times 256)
$$

| Set relative vertical print position in page mode |  |
| :--- | :--- |
| ASCII | $G S \backslash n \mathrm{LH}$ |
| Hexadecimal | 1 D 5 CnL nH |
| Decimal | $2992 n \mathrm{n} n \mathrm{H}$ |

The value for the horizontal and vertical movement cannot be less than the minimum horizontal movement around and must be in even units of the minimum horizontal movement amount.

Sets the relative vertical print starting position from the current position. This command can also change the horizontal and vertical motion unit. The unit of horizontal and vertical motion is specified by this command.

This command functions as follows, depending on the print starting position set by select print direction in page mode (1B 54):
When the starting position is set to the upper right or lower left of the printing area, the vertical motion unit (y) is used.
When the starting position is set to the upper left or lower right of the printing area, the horizontal motion unit $(x)$ is used.

## Formulas

The distance from the current position is set to $[(n L+n H \times 256) \times($ vertical or horizontal motion unit)] inches. The amount of movement is calculated only for the paper roll.

When pitch $n$ is specified to the movement downward: $n \mathrm{~L}+n \mathrm{H} \times 256=n$
When pitch $n$ is specified to the movement upward (the negative direction), use the complement of 65536.

When pitch $n$ is specified to the movement upward: $n \mathrm{~L}+n \mathrm{H} \times 256-65536-\mathrm{N}$

## Exceptions

This command is used only in page mode, otherwise it is ignored.
Any setting that exceed the specified printing area is ignored.

## Macros

These commands are used to select and perform a user-defined sequence of printer operations.

| Select or cancel macro definition |  |
| :--- | :--- |
| ASCII | GS: |
| Hexadecimal | 1D 3 A |
| Decimal | 2958 |

Starts or ends macro definition. Macro definition begins when this command is received during normal operation and ends when this command is received during macro definition. The macro definition is cleared, during definition of the macro when the execute macro (1D 5E) command is received.

Normal printing occurs while the macro is defined. When the power is turned on the macro is not defined.
The defined contents of the macro are not cleared by the initialize printer (1B 40), thus, the initialize printer (1B 40) command may be used as part of the macro definition.

If the printer receives a second select or cancel macro definition (1D 3A) command immediately after previously receiving a select or cancel macro definition (1D 3A) the printer remains in the macro undefined state.

## Formulas

The contents of the macro can be defined up to 1024 bytes.

## Exceptions

If the macro definition exceeds 1024 bytes, excess data is not stored.

| Execute macro |  |
| :--- | :--- |
| ASCII | GS^rtm |
| Hexadecimal | 1D 5E rtm |
| Decimal | 2994 rtm |

Value of r: The number of times to execute the macro

Value of $\mathrm{t}: \quad$ The waiting time for executing the macro

Executes a macro. After waiting for a specified period the printer waits for the paper feed button to be pressed. After the button is pressed, the printer executes the macro once. The printer repeats this operation the number of specified times.
When the macro is executed by pressing the paper feed button ( $m=1$ ), paper cannot be fed by using the paper feed button.

## Formulas

The waiting time is $t \times 100 \mathrm{~ms}$ for every macro execution. When the Least Significant Bit (LSB) of $m=0$, the macro is executed $r$ times continuously at the interval specified by t .
When the Least Significant Bit (LSB) of $m=1$, after waiting for the period specified by $t$, the LED indicator blinks, and the device waits for the FEED button to be pressed. After the button is pressed, the device executes the macro once. The device repeats the operation $r$ times.

## Exceptions

If this command is received while a macro is being defined, the macro definition is aborted and the definition is cleared.
If the macro is not defined or if $r$ is 0 , nothing is executed.
When the macro is executed by pressing the FEED button ( $m=1$ ), the paper cannot be fed using the FEED button.

## Miscellaneous configuration commands

| Hardware reset |  |  |
| :--- | :--- | :--- |
|  | First variation | $\underline{\text { Second variation }}$ |
| ASCII | FS 0xCO CAN DLE DC4 SUB | FS 0xCO CAN DLE DC4 ESC |
| Hexadecimal | 1C CO 1810 14 1A | 1C CO 18 1014 1B |
| Decimal | 2819224162026 | 2819224162027 |

When this command is received, the device perform a hardware reset.
This command is executed immediately, even when the data buffer is full (Busy).

## Related information

First variation: The command execution stop the communication with host.

Second variation: The command execution keep the communication with host active.

| Select printing density |  |
| :--- | :--- |
| ASCII | GS I $n$ |
| Hexadecimal | 1D 7C $n$ |
| Decimal | $29124 n$ |

Value of $\boldsymbol{n}: \quad$| 2,50 | $=-25 \%$ |
| ---: | :--- |
| 3,51 | $=-12.5 \%$ |
| 4,52 | $=0 \%$ |
| 5,53 | $=+12.5 \%$ |
| 6,54 | $=+25 \%$ |

## Default: 4

## Related information

Printing density reverts to the default value when the device is reset or turned off.

| Select virtual paper end limit |  |
| :--- | :--- |
| ASCII | GS 0xE6 nH nL |
| Hexadecimal | $1 \mathrm{DE6nH} \mathrm{~nL}$ |
| Decimal | 29230 nH nL |
| Range of $\mathbf{n H}, \mathrm{nL}:$ | $0-255$ |
|  |  |
| Default: | $n \mathrm{nH}=0$ |
|  | $n \mathrm{LL}=240$ |

This command sets the limit, expressed in cm as $[(n \mathrm{H} \times 256)+n \mathrm{~L}]$, after which is pointed out the virtual paper-end.

| Select print speed | GS OxFO $n$ |
| :--- | :--- |
| ASCII | 1 FO $n$ |
| Hexadecimal | $29240 n$ |
| Decimal | $0=$ High quality <br> $1=$ Normal <br> $2=$ High speed |
| Value of $n:$ | 2 |

## Related information

Print speed reverts to the default value when the device is reset or turned off.

## Appendix A: Commands listed by hexadecimal code

| Code (hexadecimal) | Command | Page |
| :---: | :---: | :---: |
| 08 | Back space | 26 |
| 09 | Horizontal tab | 26 |
